Transportation Energy Data Book Quick Facts

Petroleum

- The U.S. produces 7.5 million barrels of petroleum per day (M bpd), or 9% of the world's 82.43 M bpd.
- The U.S. consumes 19.15 M bpd, or 22.5% of the world's 85.26 M bpd.
- U.S. transportation petroleum use is 69.7% of total U.S. petroleum use.
- U.S. transportation petroleum use is 172.5% of total U.S. petroleum production.
- Petroleum comprises 93.2% of U.S. transportation energy use.
- Cars and light trucks account for 64% of U.S. transportation petroleum use.
- Medium trucks account for 4% of U.S. transportation petroleum use.
- Heavy trucks account for 17% of U.S. transportation petroleum use.

Energy

- U.S. transportation energy use accounts for 28.1% of total U.S. energy use.
- 99% of ethanol consumed in the U.S. is consumed as ethanol in gasohol (or "E10").
- Cars and light trucks account for 60% of U.S. transportation energy use.
- Medium trucks account for 4% of U.S. transportation energy use.
- Heavy trucks account for 18% of U.S. transportation energy use.

Light Vehicle Characteristics

- There are 134,880,000 cars and 100,154,000 light trucks in the U.S. (235,034,000 total light vehicles).
- U.S. cars:
 - o 5,635,000 cars were sold in 2010.
 - The average age of a U.S. car is 10.6 years; the average car lifetime is 16.9 years.
 - The average fuel economy for the U.S. car fleet (all cars on the road today) is 22.5 mpg.
 - Cars comprise 48.8% of new light vehicle sales.
- U.S. light trucks:
 - 5,919,000 light trucks were sold in 2010.
 - The average age of a U.S. light truck is 9.6 years; the average car lifetime is 15.5 years.
 - The average fuel economy for the U.S. light truck fleet (all light trucks on the road today) is 18.0 mpg.
 - o Light trucks comprise 51.2% of new light vehicle sales.
- There were 8,030,000 fleet vehicles in 2009: 3,844,000 cars and 4,186,000 trucks.
- U.S. car registrations account for 20.4% of total world car registrations.
- U.S. truck and bus registrations account for 40.8% of total world car registrations.
- The average U.S. household vehicle travels 11,300 miles per year.

Heavy Truck Characteristics

- 10,973,000 heavy trucks were registered in the U.S. in 2009.
- In 2002 (the last time a survey was conducted), heavy trucks accounted for 80% of medium and heavy truck fuel use.

Note: Data are for calendar year 2009 or 2010 unless otherwise noted.

Prepared for the Vehicle Technologies Program Office of Energy Efficiency and Renewable Energy U.S. Department of Energy

Prepared by the Oak Ridge National Laboratory Oak Ridge, Tennessee 37831-6073 Managed by UT-BATTELLE, LLC for the U.S. DEPARTMENT OF ENERGY under Contract No. DE-AC05-00OR22725

DOCUMENT AVAILABILITY

Reports produced after January 1, 1996, are generally available free via the U.S. Department of Energy (DOE) Information Bridge:

Web site: http://www.osti.gov/bridge

Reports produced before January 1, 1996, may be purchased by members of the public from the following source:

National Technical Information Service 5285 Port Royal Road Springfield, VA 22161 *Telephone:* 703-605-6000 (1-800-553-6847) *TDD:* 703-487-4639 *Fax:* 703-605-6900 *E-mail:* info@ntis.fedworld.gov *Web site:* http://www.ntis.gov/support/ordernowabout.htm

Reports are available to DOE employees, DOE contractors, Energy Technology Data Exchange (ETDE) representatives, and International Nuclear Information System (INIS) representatives from the following source:

Office of Scientific and Technical Information P.O. Box 62 Oak Ridge, TN 37831 *Telephone:* 865-576-8401 *Fax:* 865-576-5728 *E-mail:* reports@adonis.osti.gov *Web site:* http://www.osti.gov/contact.html

This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States government nor any agency thereof, nor any of their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise, does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government or any agency thereof. The views and opinions of authors expressed herein do not necessarily state or reflect those of the United States Government or any agency thereof.

Users of the *Transportation Energy Data Book* are encouraged to comment on errors, omissions, emphases, and organization of this report to on e of the persons listed below. Requests for additional complementary copies of this report, additional data, or information on an existing table should be referred to Ms. Stacy Davis, Oak Ridge National Laboratory.

TRANSPORTATION ENERGY DATA BOOK: EDITION 30-2011

xviii

FOREWORD

Welcome to this 30th edition of the Transport ation Energy Data Book. Twenty-two of these editions have been p roduced by Stacy Davis. I and the Vehicle Technologies Program are grateful for the dedication, consistency, and the skill she has brought to this effort.

I would like to bring to your attention some of the data that are new in this edition:

Table 3.13. Heavy Truck Scrappage and Survival Rates -- Data for heavy trucks, which had been in previous editions, is added back into the report.

Table 6.2. Alternative Fuel Transit Vehicles, 2009 -- For eight modes, the average vehicle age, the percent powered by alternative fuels, and the number of vehicles are provided.

Fifteen new emission standards tables hav e been added t o Chapter 12. They include the following:

- Table 12.12. Light-Duty Vehicle, Light-Duty Truck, and Medium-Duty Passenger Vehicle – Tier 2 Evaporative Exhaust Standards
- Table 12.13. Light-Duty Vehicle, Light-Duty Truck, and Medium-Duty Passenger Vehicle – Tier 2 Evaporative Emission Standards
- Table 12.14. Heavy-Duty Highway Compression-Ignition Engines and Urban Buses Exhaust Emission Standards
- Table 12.15. Heavy-Duty Highway Spark-Ignition Engines- Exhaust Emission Standards
- Table 12.16. Heavy-Duty Highway Compression-Ignition and Spark-Ignition Engines Evaporative Emission Standards
- Table 12.17. California Car, Light Truck, and Medium Truck Emission Certification Standards
- Table 12.18. Aircraft Exhaust Emissions Standards
- Table 12.19. Nonroad Compression-Ignition Engine Exhaust Emission Standards
- Table 12.20. Nonroad Large Spark-Ignition Engines Exhaust and Evaporative Emission Standards
- Table 12.21. Locomotive Exhaust Emissions Standards
- Table 12.22. Marine Compression-Ignition (CI) Engines Exhaust Emission Standards
- Table 12.23. Marine Spark-Ignition Engines and Vessels Exhaust Emission Standards
- Table 12.24. Nonroad Recreational Engines and Vehicles Exhaust Emission Standards

Table 12.25. Gasoline Sulfur Standards

Table 12.26. Highway, Nonroad, Locomotive, and Marine (NRLM) Diesel Fuel Sulfur Standards

I hope you find value in this data book. St acy and I welcome suggestions on how to improve it.

Jailie D. Sotteron

ACKNOWLEDGMENTS

The authors would like to express their gratitude to the many individuals who assisted in the preparation of this d ocument. First, we would like to thank Phil Patterson, Jacob Ward, and the Vehicle Technologies Program staff for their continued support of the Transportation Energy Data Book project. We would also like to thank Lindsey Marlar for the cover. Finally, this book would not have been possible without the d edication of Debbie Bain, who masterfully prepared the manuscript. xxii

ABSTRACT

The *Transportation Energy Data Book: Edition 30* is a statistical compendium prepared and published b y Oak Ridge National Laboratory (ORNL) under contract with the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Vehicle Technologies Program. Designed for use as a desk-top reference, the Data Book represents an assembly and display of statistics and information that characterize transportation activity, and presents data on othe r factors that in fluence transportation energy use. The purpos e of this document is to present relevant statistical data in the form of tables and graphs. The latest edition of the Data Book is available to a larger audience via the Internet (cta.ornl.gov/data).

This edition of the Data Book has 12 chapters which focus on various aspects of the transportation industry. Chapter 1 fo cuses on petroleum; Chapter 2 – energy; Chapter 3 – highway vehicles; Chapter 4 – light vehicles; Chapter 5 – heavy vehicles; Chapter 6 – alternative fuel vehicles; Chapter 7 – fl eet vehicles; Ch apter 8 – household v ehicles; Chapter 9 – nonhighway modes; Chapter 10 – transportation and the economy; Chapter 11 – greenhouse gas emissions; and Chapter 12 – criteria pollutant emissions. The source is used represent the latest available data. There are also three appendices which include detailed source information for some tables, measures of conversion, and the definition of Census divisions and reg ions. A glossary of terms and a title index are also included for the reader's convenience.

xxiv

INTRODUCTION

In January 1976, the Transportation Energy Conservation (TEC) Division of the Energy Research and Development Administration contracted with Oak Ridge National Laboratory (ORNL) to prepare a Transportation Energy Conservation Data Book to be used by TEC staff in their evaluation of current and proposed conservation strategies. The major purposes of the Data Book were to draw together, under one cov er, transportation data from diverse sources, to resolve data conflicts and inconsistencies, and to produce a comprehensive document. The first edition of the TEC Data B ook was published in October 1976. W ith the passa ge of the Department of Energy (DOE) Organization Act, the work bein g conducted by the former Transportation Energy Conservation Division fe ll under the purview of the DOE's Office of Transportation Programs.

Policymakers and analysts need to be well-informed about activity in the transportation sector. The organization and scope of the d ata book reflect the need for different kinds of information. For this reason, Edition 30 updates much of the same type of data that is found in previous editions.

In any attempt to compile a comprehensive set of statistics on transportation activity, numerous instances of in adequacies and inaccuracies in the basic data are encountered. Where such problems occur, estimates are developed by ORNL. To minimize the misuse of the se statistics, an appendix (Appendix A) is included to document the estimation procedures. The attempt is to provide sufficient information for the conscientious user to evaluate the estimates and to form their own opinions as to their utility. Clearly, the accuracy of the estimates cannot exceed the accuracy of the primary data, an accuracy which in most instances is unknown. In cases where data accuracy is known or substanti al errors are strongly suspected in the data, the reader is alerted. In all cases it should be recognized that the estimates are not precise.

The majority of the statistics contained in the data book are taken directly from published sources, although these data may be reformatted for presentation by ORNL. Consequently, neither ORNL nor DOE endorses the validity of these data.

Chapter 1 Petroleum

Summary Statistics from Tables/Figures in this Chapter

Source			
Table 1.3	World Petroleum Production, 2010 (million barrels per day) ^a		82.43
	U.S. Production (million barrels per day)		7.51
	U.S. Share		9.1%
Table 1.4	World Petroleum Consumption, 2010 (million barrels per day)		85.26
	U.S. Consumption (million barrels per day)		19.15
	U.S. Share		22.5%
Figure 1.5	Average Refinery Yield, 2010	OECD Europe	North America
	Gasoline	19.3%	42.7%
	Diesel oil	39.8%	25.3%
	Residual fuel	13.0%	5.8%
	Kerosene	6.8%	7.3%
	Other	21.1%	18.9%
Table 1.11	U.S. transportation petroleum use as a percent of U.S. petroleum production, 2010		172.5%
Table 1.11	Net imports as a percentage of U.S. petroleum consumption, 2010		49.3%
Table 1.12	Transportation share of U.S. petroleum consumption, 2010		69.7%
Table 1.15	Highway share of transportation petroleum consumption, 2009		86.4%
Table 1.15	Light vehicle share of transportation petroleum consumption, 2009		64.3%

^a Because other liquids and processing gain are not included, the world production is smaller than world petroleum consumption.

Although the world has consumed about 40% of estimated conventional oil resources, the total fossil fuel potential is huge. Methane hydrates—a potential source of natural gas—are included in the "additional occurrences" of unconventional natural gas, and constitute the largest resource.

Rogner, H.H., World Energy Assessment: Energy and the Challenge of Sustainability, Part II, Chapter 5, 2000, p. 149.

^a Data are not available.

In 2010, the Organization of Petroleum Exporting Countries (OPEC) accounted for more than 40% of world oil production. Responding to low oil prices in early 2000, Mexico, Norway, Russia, and Oman joined OPEC in cutting production. This group of oil countries, referred to here as OPEC+, account for over 60% of world oil production.

Table 1.2World Crude Oil Production, 1960–2010a(million barrels per day)

Source:

U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review, March 2011*, Washington, DC, 2011, Table 11.1a and 11.1b. (Additional resources: www.eia.doe.gov)

^a Includes lease condensate. Excludes natural gas plant liquids.

^b See Glossary for membership.

^c OPEC+ includes all OPEC nations plus Russia, Mexico, Norway and Oman.

^d See Glossary for Persian Gulf Nations.

This table shows petroleum production, which includes both crude oil and natural gas plant liquids. Because other liquids and processing gain are not included, the world total is smaller than world petroleum consumption (Table 1.4). The United States was responsible for 9.1% of the world's petroleum production in 2010 and 7.5% of the world's crude oil production (Table 1.2).

^b Organization of Petroleum Exporting Countries. See Glossary for membership.

The United States has accounted for almost one-quarter of the world's petroleum consumption for the last two decades, but in 2010 accounted for only 22.5%. World petroleum consumption decreased in 2009 but rose in 2010. Non-OECD consumption has continued to increase.

Energy Information Administration, International Energy Statistics, 2011. (Additional resources: www.eia.doe.gov)

Note: Reserves as of May 2011. Production data are dry gas production.

The share of petroleum imported to the United States can be calculated using total imports or net imports. Net imports, which are the preferred data, rose to 50% of U.S. petroleum consumption for the first time in 1998, while total imports reached 50% for the first time in 1993. OPEC share of net imports has been below 50% since 1993.

Major oil price shocks have disrupted world energy markets five times in the past 30 years (1973-74, 1979-80, 1990-91, 1999-2000, 2008). Most of the oil price shocks were followed by an economic recession in the United States.

Source:

Greene, D.L. and N. I. Tishchishyna, *Costs of Oil Dependence: A 2000 Update*, Oak Ridge National Laboratory, ORNL/TM-2000/152, Oak Ridge, TN, 2000, and data updates, 2011. (A dditional resources: www-cta.ornl.gov/publications)

The United States has long recognized the problem of oil dependence and the economic problems that arise from it. According to Oak Ridge National Laboratory (ORNL) researchers Greene and Hopson, oil dependence is a combination of four factors: (1) a noncompetitive world oil market strongly influenced by the OPEC cartel, (2) high levels of U.S. imports, (3) the importance of oil to the U.S. economy, and (4) the lack of economical and readily available substitutes for oil. ORNL developed a model to estimate the historical cost of oil dependence and analyze the potential effectiveness of policies on likely future costs. The most recent study using this model shows that the U.S. economy suffered the greatest losses in 2008 when wealth transfer and GDP losses (combined) amounted to approximately half a trillion dollars. However, when comparing oil dependence to the size of the economy, the year 1980 is the highest. Oil dependence costs were almost 4.5% of GDP in 1980, but were under 3.5% in 2008. In 2009, the average oil price fell to about \$60 per barrel and oil dependence costs fell to about \$300 billion for 2009 and 2010.

Source:

Greene, David L., Roderick Lee, and Janet L. Hopson, "OPEC and the Costs to the U.S. Economy of Oil Dependence: 1970-2010," Oak Ridge National Laboratory Memorandum, 2011.

Notes:

Wealth Transfer is the product of total U.S. oil imports and the difference between the actual market price of oil (influenced by market power) and what the price would have been in a competitive market.

Dislocation Losses are temporary reductions in GDP as a result of oil price shocks.

Loss of Potential Gross Domestic Product (GDP) results because a basic resource used by the economy to produce output has become more expensive. As a consequence, with the same endowment of labor, capital, and other resources, our economy cannot produce quite as much as it could have at a lower oil price.

Other parts of the world refine crude oil to produce more diesel fuel and less gasoline than does North America. The OECD Europe countries produce the lowest share of gasoline in 2010.

Source:

International Energy Agency, Monthly Oil Survey, January 2011. (Additional resources: www.iea.org)

^a Includes jet kerosene and other kerosene.

^b Includes motor gasoline, jet gasoline, and aviation gasoline.

^c Organization for Economic Cooperation and Development. See Glossary for membership.

Oxygenate refinery input increased significantly in 1995, most certainly due to the Clean Air Act Amendments of 1990 which mandated the sale of reformulated gasoline in certain areas beginning in January 1995. The use of MTBE has declined in recent years due to many states banning the additive. The other hydrocarbons and liquids category includes unfinished oils, motor gasoline blending components and aviation gasoline blending components. In 2005 the gasoline blending components rose significantly.

^a Methyl tertiary butyl ether (MTBE). ^b Includes methanol and other oxygenates.

^c Reported in "Other" category in this year.

^d Data are not available.

When crude oil and other hydrocarbons are processed into products that are, on average, less dense than the input, a processing volume gain occurs. Due to this gain, the product yield from a barrel of crude oil is more than 100%. The processing volume gain has been growing over the years.

Department of Energy, Energy Information Administration, *Petroleum Supply Navigator*, Vol.1, March 2011. (Additional resources: www.eia.doe.gov)

^a Includes aviation gasoline (0.1%), kerosene (0.1%), residual fuel oil (4.0%), naphtha and other oils for petrochemical feedstock use (1.0%), other oils for petrochemical feedstock use (1.0%), special naphthas (0.2%), lubricants (1.0%), waxes (0.1%), petroleum coke (5.3%) asphalt and road oil (2.4%), still gas (4.3%), and miscellaneous products (0.5%).

^b Products sum greater than 100% due to processing gain. The processing gain for years 1978 to 1980 is assumed to be 4 percent.

Domestic petroleum production increased in 2009 for the first time in 20 years. Most of the petroleum imported by the United States is in the form of crude oil. The United States does export small amounts of petroleum, mainly refined petroleum products which go to Canada and Mexico.

U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, March 2011, Tables 3.1 and 3.3b and *Annual Energy Review*, Table 5.3.

^a Total domestic production includes crude oil, natural gas plant liquids and small amounts of other liquids.

TRANSPORTATION ENERGY DATA BOOK: EDITION 30-2011

The U.S. share of the world's petroleum consumption is slightly less than one-quarter. The United States relies heavily on imported petroleum. Imports accounted for nearly 50% of U.S. petroleum consumption in 2010.

	Domestic petroleum production ^a	Net petroleum imports	Transportation petroleum consumption	U.S. petroleum consumption	World petroleum consumption		U.S. petroleum consumption as a share of world	Transportation petroleum use as a share of domestic

 Table 1.11

 Petroleum Production and Consumption and Some Important Percent Shares, 1950–2010

Sources:

U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, March 2011, Tables 2.5, 3.1, and A3. (Pre-1973 data from the *Annual Energy Review*). World petroleum consumption - U.S. Department of Energy, Energy Information Administration, *International Energy Statistics Website*, March 2011. (Additional resources: www.eia.doe.gov)

^a Total domestic production includes crude oil, natural gas plant liquids and small amounts of other liquids. ^b Data are not available.

Before 1989 the U.S. produced enough petroleum to meet the needs of the transportation sector, but was still short of meeting the petroleum needs of all the sectors, including industrial, residential and commercial, and electric utilities. In 1973 the gap between what the U.S. produced and what was consumed was 5.6 million barrels per day. By 2035, the gap is expected to be at least 10.8 million barrels per day if all sources of petroleum are included or 13.9 million barrels per day if only conventional petroleum sources are used.

Figure 1.6. United States Petroleum Production and Consumption – All Sectors, 1973–2035

Source:

See Tables 1.12 and 2.7. Projections are from the Energy Information Administration, *Annual Energy Outlook* 2011, April 2011.

Notes: The U.S. Production has two lines after 2005. The solid line is conventional sources of petroleum, including crude oil, natural gas plant liquids, and refinery gains. The dashed line adds in o ther non-petroleum sources, including ethanol, biomass, liquids from coal, other blending components, other hydrocarbons, and ethers.

The sharp increase in values between 2006 and 2007 is the result of the FHWA's methodology change.

The data change from historical to projected values occurs between 2009 and 2010.

In 1989 the transportation sector petroleum consumption surpassed U.S. petroleum production for the first time, creating a gap that must be met with imports of petroleum. By the year 2035, transportation petroleum consumption is expected to grow to more than 16 million barrels per day; at that time, the gap between U.S. production and transportation consumption will be about 3.8 million barrels per day (when including the non-petroleum sources).

Source:

See Tables 1.12 and 2.7. Projections are from the Energy Information Administration, Annual Energy Outlook 2011, April 2011.

Notes: The U.S. Production has two lines after 2005. The solid line is conventional sources of petroleum, including crude oil, natural gas plant liquids, and refinery gains. The dashed line adds in o ther non-petroleum sources, including ethanol, biomass, liquids from coal, other blending components, other hydrocarbons, and ethers.

The sharp increase in values between 2009 and 2010 are caused by the data change from historical to projected values. The sharp increase in the value for heavy trucks between 2006 and 2007 is the result of the FHWA's methodology change.

Transportation accounted for almost 70% of the U.S. petroleum use in 2010. Total petroleum consumption reached more than 20 million barrels per day from 2004 to 2007, but has been below that level since then.

U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, March 2011, Tables 2.2–2.6. Converted to million barrels per day using Table A3. (Additional resources: www.eia.doe.gov)

Due to changes in the FHWA fuel use methodology, motorcycle, bus, and heavy truck data are not comparable with data before the year 2007. Light trucks include pick-ups, minivans, sport-utility vehicles, and vans. See Table 2.7 for highway energy use in trillion Btu.

See Appendix A for Highway Energy Use.

^a Each gallon of petroleum product was assumed to equal one gallon of crude oil. The oil used to produce electricity is also estimated. See Appendix A, p. 18 for details.

^b Total transportation figures do not include military and off-highway energy use and may not include all possible uses of fuel for transportation (e.g., snowmobiles).

Although about 18% of transportation energy use is for nonhighway modes, only 14% of transportation petroleum use is for nonhighway. This is because some nonhighway modes, such as pipelines and transit rail, use electricity. An estimate for the petroleum used to make electricity is included in the data. See Table 2.8 for nonhighway transportation energy use in trillion Btu.

Petroleum accounted for 35% of the world's energy use in 2008. Though petroleum is the dominant energy source for both OECD countries and non-OECD countries, the non-OECD countries rely on coal, natural gas, and hydro-electric power more than OECD countries do.

Source:

U.S. Department of Energy, Energy Information Administration, *International Energy Statistics Database*, May 2011. (Additional resources: www.eia.doe.gov)

Total energy use was 98.0 quads in 2010 with transportation using 28.1%. The Energy Information Administration includes renewable energy in each sector.

U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, April 2011, Washington, DC, Table 2.1. (Additional resources: www.eia.doe.gov)

^a Electrical energy losses have been distributed among the sectors.

In transportation, the alcohol fuels blended into gasoline to make gasohol (10% ethanol or less) are counted under "renewables" and are not in with petroleum. The petroleum category, however, still contains other blending agents, such as MTBE, that are not actually petroleum, but are not broken out into a separate category.

Note: Numbers may not add due to rounding.

use.

^c Includes electrical system energy losses.

^a In transportation, the petroleum category contains some blending agents which are not petroleum. ^b Includes supplemental gaseous fuels. Transportation sector includes pipeline fuel and natural gas vehicle

Oxygenates are blended with gasoline to be used in conventional vehicles. The amount of oxygenate use dwarfs the alternative fuel use. Gasoline-equivalent gallons are used in this table to allow comparisons of different fuel types.

Table 2.3 Alternative Fuel and Oxygenate Consumption, 2003–2009 (thousand gasoline–equivalent gallons)

Source:

U.S. Department of Energy, Energy Information Administration, *Alternatives to Traditional Transportation Fuels*, 2009, Washington, DC, April 2011, Web site

www.eia.doe.gov/renewable/alternative_transport_vehicles/index.cfm. (Additional resources: www.eia.doe.gov)

^a Consumption includes gasoline portion of the mixture.

^b Vehicle consumption only; does not include power plant inputs.

^c Methyl Tertiary Butyl Ether. This category includes a very small amount of other ethers, primarily Tertiary Amyl Methyl Ether (TAME) and Ethyl Tertiary Butyl Ether (ETBE).

Ethanol is used as an oxygenate, blended with gasoline to be used as gasohol in conventional vehicles. The amount of ethanol used in gasohol dwarfs the amount used in E85. Production of E95 ended in 2000.

U.S. Department of Energy, Energy Information Administration, *Alternatives to Traditional Transportation Fuels*, 2009, Washington, DC, April 2011, Web site: http://www.eia.doe.gov/renewable/alternative_transport_vehicles/index.cfm, Table C1. (Additional resources:

http://www.eia.doe.gov/renewable/alternative_transport_vehicles/index.cfm, Table C1. (Additional resources: www.eia.doe.gov)

Note: Gallons of E85, E95 and Ethanol in gasohol, do not include the gasoline portion of the blended fuel.

As data about alternative fuel use become available, an attempt is made to incorporate them into this table. Sometimes assumptions must be made in order to use the data. Please see Appendix A for a description of the methodology used to develop these data. See Table 1.15 for transportation petroleum use in thousand barrels per day.

See Appendix A for Nonhighway Energy Use.

Note: Totals may not add due to rounding.

^a Total transportation figures do not include military and off-highway energy use and may not include all possible uses of fuel for transportation (e.g., snowmobiles).

The Environmental Protection Agency's NONROAD2008a model estimates fuel use for different types of equipment and off-highway vehicles. Most of these vehicles/equipment use diesel fuel. Recreational equipment, such as offhighway motorcycles, snowmobiles, and ATVs, are mainly fueled by gasoline.

Table 2.9 Off-highway Transportation-related Fuel Consumption from the NonRoad Model, 2009 (trillion Btus)

	Gasoline	Diesel	LPG	CNG	Total
Agricultural Equipment Tractors, mowers, combines, balers, and other farm equipment which has utility in its movement.	8.3	543.0	0.0	0.0	551.3

Source:

U.S. Environmental Protection Agency, NONROAD2008a Model, www.epa.gov/otaq/nonrdmdl.htm.

^a Includes equipment such as aerators, dethatchers, sod cutters, hydro-seeders, turf utility vehicles, golf course greens mowers, and sand trap groomers.

^b Includes equipment not otherwise classified such as augers, sickle-bar mowers, and wood splitters.

The Federal Highway Administration (FHWA) cautions that data from 1993 on may not be directly comparable to earlier years. Some states have improved reporting procedures in recent years, and the estimation procedures were revised in 1994. Now, the FHWA does not publish separate estimates of gasohol or ethanol used in gasohol. See Table 2.3 for details on oxygenate usage.

Year	Total gasoline and gasohol	Diesel ^a	Percent diesel	Total highway fuel use
1973	100.6	9.8	8.9%	110.5

Table 2.11 Highway Usage of Gasoline and Diesel, 1973–2009 (billion gallons)

Source:

U.S. Department of Transportation, Federal Highway Administration, *Highway Statistics 2009*, Washington, DC, 2011, Table MF-21 and annual. (Additional resources: www.fhwa.dot.gov)

^a Consists primarily of diesel fuel, with small quantities of other fuels, such as liquefied petroleum gas and E85.

2-13

Great care should be taken when comparing modal energy intensity data among modes. Because of the inherent differences among the transportation modes in the nature of services, routes available, and many additional factors, it is not possible to obtain truly comparable national energy intensities among modes. These values are averages, and there is a great deal of variability even within a mode.

Source:

See Appendix A for Passenger Travel and Energy Use.

^a Includes passenger cars, vans, and small buses operating in response to calls from passengers to the transit operator who dispatches the vehicles.

^b Data are not available.

^c Energy use is estimated.

^d Only domestic service and domestic energy use are shown on this table. (Previous editions included half of international energy.) These energy intensities may be inflated because all energy use is attributed to passengers–cargo energy use is not taken into account.

Great care should be taken when comparing modal energy intensity data among modes. Because of the inherent differences among the transportation modes in the nature of services, routes available, and many additional factors, it is not possible to obtain truly comparable national energy intensities among modes. These values are averages, and there is a great deal of variability even within a mode.

	Cars	52.7%
	Two-axle, four-tire trucks	36.4%
	Combination trucks	5.7%
	Other single-unit trucks	4.1%
	Motorcycles	0.7%
	Buses	0.5%
Table 3.9	Average age of vehicles, 2009	
	Cars (years)	10.6
	Light trucks (years)	9.6
	All trucks (years)	10.2

Use caution comparing historical data because of disconnects in data series. Also, the United States is unique in how many light trucks (SUVs, minivans, pickups) are used for personal travel. Those light trucks are not included on this table. The U.S. share of world cars continues to decline. The growth in the World total comes mainly from developing countries, like China and India.

VEHICLES IN USE

Both the Federal Highway Administration (FHWA) and The Polk Company report figures on the car and truck population each year. The two estimates, however, differ by as much as 11.2% (1981). The differences can be attributed to several factors:

- The FHWA data include all vehicles which have been registered at any time throughout the calendar year. Therefore, the data include vehicles which were retired during the year and may double count vehicles which have been registered in different states or the same states to different owners. The Polk Company data include only those vehicles which are registered on July 1 of the given year.
- The classification of mini-vans, station wagons on truck chassis, and utility vehicles as cars or trucks causes important differences in the two estimates. The Polk Company data included passenger vans in the car count until 1980; since 1980 all vans have been counted as trucks. Recently, the Federal Highway Administration adjusted their definition of cars and trucks. Starting in 1993, some minivans and sport utility vehicles that were previously included with cars were included with trucks. This change produced a dramatic change in the individual percentage differences of cars and trucks. The difference in total vehicles has been less than 5% each year since 1990 and do es not appear to be significantly affected by the FHWA reclassifications.
- The FHWA data include all non-military Federal vehicles, while The Polk Company data include only those Federal vehicles which are registered within a state. Federal vehicles are not required to have State registrations, and, according to the Ge neral Services Administration, most Federal Vehicles are not registered.

According to The Polk Company statistics, the number of cars in use in the United States declined from 1991 to 1992. This is the first decline in vehicle stock since the figures were first reported in 1924. However, the data should be viewed with caution. A redesign of Polk's approach in 1992 allowed a national check for duplicate registrations, which was not possible in earlier years. Polk estimates that, due to processing limitations, its vehicle population counts may have been in flated by as much as 1¹/₂ percent. Assuming that percentage is correct, the number of cars in use would have declined from 1991 to 1992 under the previous Polk method. The growing popularity of light trucks being used as passenger vehicles could also have had an impact on these figures.

In the early 1980's, researchers had to make a conscience choice of which data series to use, since they differed by as much as 11%. In 2009 the two sources differed by about 1%. Both sources show a decline in automobiles from 2008 to 2009 and an increase in trucks. The series, however, seem to be growing further apart.

Table 3.3 U.S. Cars and Trucks in Use, 1970–2009 (thousands)

Source:

FHWA - U.S. Department of Transportation, Federal Highway Administration, 1970-2008, *Highway Statistics 2008*, Washington, DC, 2009, Table VM-1 and annual. 2009 data f rom tables MV-1 and MV-9. (Additional resources: www.fhwa.dot.gov)

Polk - The Polk Company, Detroit, Michigan. FURTHER REPRODUCTION PROHIBITED. (Additional resources: www.polk.com)

The graphs below show the number of motor vehicles per thousand people for various countries. The data for the United States are displayed in the line which goes from 1900 to 2009. The points labeled on that line show data for the other countries/regions around the world and how their vehicles per thousand people compare to the United States at two different points in time, 1999 and 2009. For instance, the graph shows that in 1999, Western Europe's vehicles per thousand people was about where the United States was in 1969, but by 2009 it is about where the United States was in 1972. The lower part of the graph (1900-1940) is shown enlarged on the facing page.

Source: See Tables 3.4 and 3.5.

Though some countries are listed separately in this table, those countries are also included in the regional total. For instance, China is listed separately, but is also included in the Asia, Far East region.

	Vehicles per 1	,000 people
Country/Region	1999	2009
Africa	20.9	24.9
Asia, Far East	39.1	157.7
Asia, Middle East	66.2	101.2
Brazil	107.5	149.2
Canada	560.0	620.9
Central & South America	133.6	169.7
China	10.2	46.2
Europe, East	370.0	363.9
Europe, West	528.8	583.3
India	8.3	14.4
Indonesia	13.7	35.9
Pacific	513.9	560.9

All others: Ward's Communications, Ward's Motor Vehicle Data 2010, pp. 271–274. (Additional resources: www.fhwa.dot.gov, www.wardsauto.com) The number of vehicles per thousand people in the United States has grown significantly from 1900 to 2009. In 2008 to 2009, however, the number decreased from a high of 843.57 in 2007.

 Table 3.5

 Vehicles per Thousand People in the United States, 1990-2009

Sources:

Population – (2009) U.S. Census Bureau, Population Division, International Data Base (IDB) World, May 5, 2011. (Additional resources: http://www.census.gov/ipc/www/idb/)

Vehicles – (2008) U.S.: U.S. Department of Transportation, Federal Highway Administration, *Highway Statistics* 2009, Washington, DC, 2011. All others: Ward's Communications, Ward's Motor Vehicle Data 2009, pp. 257–260. (Additional resources: www.fhwa.dot.gov, www.wardsauto.com) Total vehicle-miles traveled decreased slightly from 2008 to 2009. The trend of using two-axle, four-tire trucks, such as pickups, vans, and sport-utility vehicles, for personal travel is evident in these data; two-axle, four-tire trucks account for 25.3% more travel in 2009 than in 1970, and cars account for 29.9% less travel in that time period.

			Two- axle,four-	Other single-unit	Combination		Total vehicle-miles traveled

Table 3.8Trucks in Operation and Vehicle Travel by Age, 1970 and 2001

Source:

The Polk Company, Detroit, MI. FURTHER REPRODUCTION PROHIBITED.

Vehicle travel—The average annual vehicle-miles per truck by age were multiplied by the number of trucks in operation by age to estimate the vehicle travel. Average annual miles per truck by age were generated by ORNL from the 1997 Truck Inventory and Use Survey public use tape provided by U.S. Department of Commerce, Bureau of the Census, Washington, DC, 2000. (Additional resources: www.polk.com, www.census.gov)

^a Includes trucks from model year 2002 and 2001 which were sold prior to July 1, 2002, and similarly, model years 1971 and 1970 sold prior to July 1, 1970.

Table 3.10 New Retail Vehicle Sales, 1970–2010 (thousands)

Source:

1970-2010: Ward's Communications, www.wardsauto.com.

Using current registration data and a scrappage model by Greenspan and Cohen, [1996 paper: http://www.federalreserve.gov/pubs/feds/1996/199640/199640pap.pdf], ORNL calculated new automobile scrappage rates. The expected median lifetime for a 1990 model year automobile is 16.9 years. These data are fitted model values which assume constant economic conditions.

Table 3.14
Car and Light Truck Survivability Rates and Lifetime Miles

Source:

U.S. Department of Transportation, National Highway Traffic Safety Administration, Vehicle Survivability and Travel Mileage Schedules, January 2006.

Note: Registration data from 1977 to 2002 were used in developing these estimates. In this analysis, vehicle age was cut off when the estimated survival rate reached approximately a two percent threshold; for cars, this was 25 years, and for trucks it was 36 years.

^a Data are not available.

 Summary Statistics for Two-Axle, Four-Tire Trucks, 1970–2009

Source:

U.S. Department of Transportation, Federal Highway Administration, *Highway Statistics 2009*, Washington, DC, 2011, Table MV-9. Previous years Table VM-1. (Additional resources: www.fhwa.dot.gov)

^a Beginning in this year the data were revised to include all vans (including mini-vans), pickups and sport utility vehicles.

^b Because vehicle travel, fuel use, and fuel economy are no longer published for cars, the 2009 data were estimated.

Because data on Class 2b trucks are scarce, the U.S. DOE funded a study to investigate available sources of data. In the final report, four methodologies are described to estimate the sales of Class 2b trucks. Until another study is funded, the 1999 data are the latest available.

	CY 1999 truck sales (millions)	MY 2000 truck population (millions)	Percent diesel trucks in population	Average age (years)	Estimated annual miles ^a (billions)	Estimated fuel use (billion ^a gallons)	Estimated fuel economy (miles per gallon)
Class 1	5.7	49.7	0.3%	7.3	672.7	37.4	18.0
Class 2a	1.8	19.2	2.5%	7.4	251.9	18.0	14.0
Class 2b	0.5	5.8	24.0%	8.6	76.7	5.5	13.9

 Sales Estimates of Class 1, Class 2a, and Class 2b Light Trucks, 1989–1999

Source:

Davis, S.C. and L.F. Truett, Investigation of Class 2b Trucks (Vehicles of 8,500 to 10,000 lbs GVWR), ORNL/TM-2002/49, March 2002, Table 1.

Note: These data were calculated using Methodology 4 from the report.

^a Estimates derived using 2000 population data and 1997 usage data. See source for details.

Car sales in 2009 and 2010 were below 6 million. In 1980, the Big 3 (Chrysler, Ford and General Motors) held 73.8% of the market; by 2010, that had dropped to 31.8%.

^a Includes all trucks of 10,000 pounds gross vehicle weight and less sold in the United States.

^b Excluding transplants.

^c Big 3 includes Chrysler, Ford and General Motors. Beginning in 1998, Ford includes Land Rover and Volvo light trucks and GM includes Saab. Trucks include light, medium and heavy trucks.

^d Based on model year factory installations.

^e Light-duty vehicles include cars and light trucks.

^f Indicates less than 1 percent.

The sales-weighted fuel economy of new cars (including wagons) increased dramatically from 1975 (15.8 mpg) to 1985 (27.0 mpg), but rose only 2.5 mpg from 1985 to 2005. Since 2005, fuel economy rose 3.2 mpg—from 29.5 mpg in 2005 to 32.7 mpg in 2010.

^a The fuel economy data on this table are EPA laboratory test values.

^b No vehicles in this category were sold in this model year.

The term "wagon" conjures up images of the station wagons from the 1960's. However, most of the cars that are now classified as wagons have little in common with those station wagons. The wagons below make up the category "wagon" on Tables 4.7 through 4.14.

Small Wagon
Audi A3
Audi A3 Quattro
Audi A4 Avant Quattro
BMW 328I Sport Wagon
BMW 328I Sport Wagon xDrive
Cadillac CTS Wagon
Cadillac CTS Wagon AWD
Chevrolet HHR FWD
Chevrolet HHR Panel FWD
Chrysler PT Cruiser
Honda Fit
Hyundai Elantra Touring
Kia Soul
Mitsubishi Lancer Sportback
Nissan Cube
Pontiac Vibe
Saab 9-3 Sportcombi
Saab 9-3X Sportcombi AWD
Subaru Impreza Wagon-Outback Sport
Suzuki SX4
Suzuki SX4 AWD
Toyota Corolla Matrix
Toyota Scion XB
Volkswagen Jetta Sportwagen
Volvo V50 AWD
Volvo V50 FWD
Midsize Wagon
Audi A6 Avant Quattro
BMW 535i Sport Wago xDrive
Kia Rondo
Lincoln MKT AWD
Lincoln MKT FWD
Subaru Outback Wagon AWD
Volkswagen Passat Wagon
Volvo V70 FWD
Volvo XC70 AWD
Large Wagon
Mercedes Benz R350 Bluetec
Mercedes Benz R350 4MATIC

Sales of light trucks in 2010 are almost three times that of 1975. Similar to the car trend, the sales-weighted fuel economy of light trucks increased substantially during the late '70's and '80's, but has increased slowly until the mid-2000's. From 2005 to 2010, fuel economy rose from 21.4 mpg to 23.8 mpg.

Note: Includes light trucks of 8,500 lbs. or less.

^a The fuel economy data on this table are EPA laboratory test values.

^b No vehicles in this category were sold in this model year.

Back in 1975 only 19% of new light vehicle sales were light trucks. Because of the boom in sales of minivans, sport utility vehicles, and pick-up trucks, that number rose to nearly 50% in 2005. In 2010, cars made a comeback to account for 58.9%.

		Model Year

Table 4.10Light Vehicle Market Shares by Size Class, Model Years 1975–2010

Source:

U.S. Environmental Protection Agency, *Light-Duty Automotive Technology, Carbon Dioxide Emissions, and Fuel Economy Trends:* 1975 *Through* 2010, November 2010. (A dditional resources: www.epa.gov/otaq/fetrends.htm)

Note: Includes light trucks of 8,500 lbs. or less.

Light trucks were gaining market share from the early 1980s until 2004, mainly due to increases in the market share of sport utility vehicles (SUVs) and pickup trucks. Small and midsize cars had a large increase in market share in 2009, likely due to the Federal Government incentive program for fuel-efficient vehicles.

Figure 4.1. Light Vehicle Market Shares, Model Years 1975–2010

Source: See Table 4.10

The midsize and large cars and wagons sales-weighted engine sizes have decreased at an average of about 2% per year since 1975.

Table 4.17Conventional Refueling Stations, 1993-2009

Sources:

Conventional refueling stations: National Petroleum News Survey, 2010.

Conventional vehicles: The Polk Company, Detroit, MI, FURTHER REPRODUCTION PROHIBITED.

Notes: The County Business Patterns (CBP) data published by the Bureau of the Census tells the number of establishments by North American Industry Classification System (NAICS). NAICS is an industry classification system that groups establishments into industries based on the activities in which they are primarily engaged. NAICS 447 represents gasoline stations. Ho wever, the CBP gasoline station data differ from the National Petroleum News Survey data by as much as 30% (117,189 stations in 2005); the CBP may not include every gasoline retail outlet due to the classification of the primary activity of the business.

Alternative Fuel Refueling Stations are listed in Chapter 6.

The National Highway Traffic Safety Administration and the Environmental Protection Agency issued joint rulemaking to establish a new National Program to regulate fuel economy and greenhouse gas emissions for model year 2012-2016 cars and light trucks.

Year	Cars	Light Trucks	Combined Cars and Light Trucks

 Table 4.18

 Fuel Economy and Carbon Dioxide Emissions Standards, MY 2012-2016

Source:

Federal Register, Vol. 75, No. 88, May 7, 2010. (Additional resources: www.nhtsa.dot.gov/portal/fueleconomy.jsp)

Note: The required fuel economy, along with projections of CO₂ emissions, are shown here.

The target levels for the proposed fuel economy and carbon dioxide emission standards for vehicles manufactured in model years 2012-2016 are assigned based on a vehicle's "footprint." Each footprint has a different target. The vehicle footprint is calculated as:

footprint = *track* width × wheelbase,

where

track width = *lateral distance between the centerlines of the base tires at ground, and wheelbase* = *longitudinal distance between the front and rear wheel centerlines.*

Table 4.19Fuel Economy and Carbon Dioxide Targets for Model Year 2016

Vehicle type	Example models	Example model footprint (square feet)	CO ₂ emissions target (grams per mile)	Fuel economy target (miles per gallon)
Example Passenger Cars				
Compact car	Honda Fit	40	214	41.4

Large pickup truck	Chevy Silverado	67	358	24.7

Source:

Federal Register, Vol. 75, No. 88, May 7, 2010.

Note: Examples use model year 2008 vehicle specifications.

The Corporate Average Fuel Economy standards were established by the U.S. Energy Policy and Conservation Act of 1975 (PL94-163). These standards must be met at the manufacturer level. Some manufacturers fall short of meeting the standards while others exceed them. Legislation passed in December 2007 changed the CAFE standards beginning in the 2011 model year. The new standards have a target of combined fleet fuel economy of 35 mpg by 2020, for all cars and light trucks.

TRANSPORTATION ENERGY DATA BOOK: EDITION 30-2011

^a Only vehicles with at least 75 percent domestic content can be counted in the average domestic fuel economy for a manufacturer.

^b Model year as determined by the manufacturer on a vehicle by vehicle basis.

^c All CAFE calculations are sales-weighted.

^d Projected 2011 required average fuel economy standards value based on pre-model year reports.

The Corporate Average Fuel Economy standards for light trucks are lower than the car standards. Light trucks include pickups, minivans, sport utility vehicles and vans. New legislation passed in December 2007 changed the CAFE standards beginning in the 2011 model year. The new standards have a target of combined fleet fuel economy of 35 mpg by 2020, for all cars and light trucks.

^h Projected 2011 required average fuel economy standards value based on pre-model year reports.

^a Only vehicles with at least 75% domestic content can be counted in the average domestic fuel economy for a manufacturer.

^b Represents two- and four-wheel drive trucks combined. Gross vehicle weight of 0-6,000 pounds for model year 1978-1979 and 0-8,500 pounds for subsequent years.

^c Model year as determined by the manufacturer on a vehicle by vehicle basis.

^d All CAFE calculations are sales-weighted.

^e Standards were set for two-wheel drive and four-wheel drive light trucks, but no combined standard was set in this year.

^f Data are not available.

^g Unreformed standards. See Table 4.18 for reformed standards.

TRANSPORTATION ENERGY DATA BOOK: EDITION 30-2011

Manufacturers of cars and light trucks whose vehicles do not meet the CAFE standards are fined. Data from the National Highway Traffic Safety Administration show CAFE fine collection dropped under \$25 million in 2002 and 2003; this was due to several factors, including the CAFE credit system, manufacturer mergers, and fines not being paid in the same year they were assessed. Fines for the 2008 and 2009 model years are still being collected.

^a These are fines which are actually collected. Fines which are assessed in certain year may not have been collected in that year.

^b Adjusted using the Consumer Price Inflation Index.

Consumers must pay the Gas Guzzler Tax when purchasing a car that has an Environmental Protection Agency (EPA) fuel economy rating (combined city and highway) less than that stipulated in the table below. The Gas Guzzler Tax doubled in 1991 after remaining constant from 1986 to 1990. The tax has not changed since 1991. This tax does not apply to light trucks such as pickups, minivans, sport utility vehicles, and vans.

Table 4.23 The Gas Guzzler Tax on New Cars (dollars per vehicle)

Source:

Internal Revenue Service, Form 6197, (R ev. 10-05), "Gas Guzzler Tax." (Additional resources: www.irs.ustreas.gov)

Consumers continue to demand gas guzzling cars though fewer gas guzzlers were bought in model year 2009 than in the previous six years. The IRS collected over \$99 million in 2009 from those buying cars with combined city/highway fuel economy less than 22.5 miles per gallon. This tax does not apply to light trucks such as pickups, minivans, sport utility vehicles, and vans. It is worthy to note that total revenue from fines paid by consumers to purchase gas-guzzling vehicles greatly exceeds the overall fines paid by manufacturers whose vehicles fail to meet CAFE standards (see Table 4.23).

The Powertrain System Analysis Toolkit (PSAT) provides vehicle simulations for a variety of research purposes. It is used by the Department of Energy to evaluate the fuel efficiency potential of advanced powertrain configurations for different driving conditions. Recently, PSAT was used to develop data on the relationship between speed and fuel economy.

Note: For specifications of the tested vehicles, please see Table 4.26.

This table shows the new methodology that the Environmental Protection Agency (EPA) used to determine fuel economy ratings for new vehicles beginning in model year 2008. In addition to the Urban Driving Cycle and the Highway Driving cycle, the EPA will also use three additional tests to adjust fuel economy ratings to account for higher speeds, air conditioner use, and colder temperatures. Though the EPA uses a complex combination of these five cycles to determine the fuel economy that will be posted on a new vehicle window sticker, the manufacturer's Corporate Average Fuel Economy is still calculated using only the city and highway driving cycles. To know more about new vehicle fuel economy ratings, visit www.fueleconomy.gov.

			Test Schedule		
	City	Highway	High Speed	AC	Cold Temp
Trip type	Low speeds in stop-and-go urban traffic	Free-flow traffic at highway speeds	Higher speeds; harder acceleration & braking	AC use under hot ambient conditions	<i>City</i> test w/colder outside temperature
Top speed	56 mph	60 mph	80 mph	54.8 mph	56 mph
Average speed	20 mph	48 mph	48 mph	22 mph	20 mph
Max. acceleration	3.3 mph/sec	3.2 mph/sec	8.46 mph/sec	5.1 mph/sec	3.3 mph/sec
Simulated distance	11 mi.	10 mi.	8 mi.	3.6 mi.	11 mi.

Vehicle air conditioning	Off	Off	Off	On	Off

Table 4.28Driving Cycle Attributes

Source:

U.S. Department of Energy and U.S. Environmental Protection Agency, Fuel Economy Web site, www.fueleconomy.gov.

^a A vehicle's engine doesn't reach maximum fuel efficiency until it is warm.

These driving cycles simulate the performance of an engine while driving in the city and on the highway. Once the city cycle is completed, the engine is stopped, and then started again for the 8.5 minute hot start cycle. Three additional cycles also influence new vehicle fuel economy ratings beginning with the 2008 model year.

U.S. Department of Energy and Environmental Protection Agency, Fuel Economy Web site, www.fueleconomy.gov.

Figure 4.6. Cold Temperature (Cold FTP) Driving Cycle

Source:

U.S. Department of Energy and Environmental Protection Agency, Fuel Economy Web site, www.fueleconomy.gov.

Beginning with the 2008 model year, this cycle influences the new vehicle fuel economy ratings. The US06 driving cycle was originally developed as a supplement to the Federal Test Procedure. It is a short-duration cycle (600 seconds) which represents hard-acceleration driving.

Source:

U.S. Department of Energy and Environmental Protection Agency, Fuel Economy Web site, www.fueleconomy.gov.

The Environmental Protection Agency also uses other driving cycles to test new vehicles (although these do not affect the fuel economy ratings). The New York Test Cycle was developed in the 1970's in order to simulate driving in downtown congested areas. The Representative Number Five Test Cycle was developed in the 1990's to better represent actual on-road driving by combining modern city and freeway driving.

Figure 4.8. New York City Driving Cycle

Figure 4.9. Representative Number Five Driving Cycle

Researchers at Argonne National Laboratory have estimated the fuel economy of a midsize car using driving cycles from different countries. These results illustrate the difference in fuel economy which can be obtained from the same vehicle using different test cycles.

Table 4.29
Projected Fuel Economies from U.S., European, and Japanese Driving Cycles

	Projected fuel economy
	for a 1995 composite
Driving Cycle	midsize vehicle ^a
Japanese 10/15 mode test cycle	17.5 mpg
New European Driving Cycle (NEDC)	22.0 mpg
U.S. EPA city cycle (LA4)	19.8 mpg
U.S. EPA highway cycle	32.1 mpg
U.S. Corporate Average Fuel Economy cycle	23.9 mpg

Source:

Santini, D., A. Vyas, J. Anderson, and F. An, *Estimating Trade-Offs along the Path to the PNGV 3X Goal*, presented at the Transportation Research Board 80th Annual Meeting, Washington, DC, January 2001.

Note: C hina and India both use the European Driving Cycle, though India uses a modified version called the Modified Indian Driving Cycle which accounts for lower maximum speeds that better represent driving conditions in India.

^a The 1995 composite midsize vehicle is an average of a Chevrolet Lumina, Chrysler Concord, and Ford Taurus. The fuel economies were projected using the National Renewable Energy Laboratory's Advanced Vehicle Simulator (ADVISOR) model.

When comparing data between countries, one must realize that different countries have different testing cycles to determine fuel economy and emissions. This table compares various statistics on the European, Japanese, and U.S. testing cycles [for fuel economy measurements, the United States uses the formula, 1/fuel economy = (0.55/city fuel economy) + (0.45/highway fuel economy)]. Most vehicles will achieve higher fuel economy on the U.S. test cycle than on the European or Japanese cycles.

	Time (seconds)	Percent of time stopped or decelerating	Distance (miles)	Average speed (mph)	Maximum speed (mph)	Maximum acceleration (mph/s)
Japanese 10/15 mode test cycle	631	52.3	2.6	14.8	43.5	1.8
New European Driving Cycle (NEDC)	1,181	24.9	6.84	20.9	74.6	2.4
U.S. EPA city cycle (LA4) ^a	1,372	43.2	7.5	19.5	56.7	3.3
U.S. EPA highway cycle	765	9.3	17.8	48.2	59.9	3.3
U.S. Corporate Average Fuel Economy cycle	2,137	27.9	10.3	29.9	59.9	3.3

 Table 4.30

 Comparison of U.S., European, and Japanese Driving Cycles

Santini, D., A. Vyas, J. Anderson, and F. An, *Estimating Trade-Offs along the Path to the PNGV 3X Goal*, presented at the Transportation Research Board 80th Annual Meeting, Washington, DC, January 2001.

Note: China and India both use the European Driving Cycle, though India uses a modified version called The Modified Indian Driving Cycle which accounts for lower maximum speeds that better represent driving conditions in India.

^a The actual Federal Procedure (FTP), which is also the test for emissions certification, repeats the first 505 seconds of the Federal Urban Driving Simulation cycle, hot started, after a 10 minute hot soak. Starting with Model Year 2001, the emissions test-but not the fuel economy test-incorporates a supplemental cycle that simulates aggressive urban driving, coupled with an added air conditioning load.

Demand response vehicles (also called paratransit or dial-a-ride) are widely used by transit agencies. The vehicles do not operate over a fixed route or on a fixed schedule. The vehicle may be dispatched to pick up several passengers at different pick-up points before taking them to their respective destinations and may even be interrupted en route to these destinations to pick up other passengers. Demand response service is provided primarily by vans. In 2007, the data changed substantially due to improved estimation methodologies. Unfortunately, those data are no longer comparable to the rest of the historical series.

Year	Number of agencies	Number of active vehicles	Vehicle-miles (millions)	Average miles per vehicle	Passenger-miles (millions)	Energy use (trillion Btu)
1994	5,214	28,729	463.7	16.14	577	9.5

Note: Due to FHWA methodology changes, data from 2007-on are not comparable with previous data.

Combination trucks include all trucks designed to be used in combination with one or more trailers. The average vehicle travel of these trucks (on a per truck basis) far surpasses the travel of other trucks due to long-haul freight movement. The data series was recently changed by the FHWA back to 2007.

	Registrations	Vehicle travel ^a	Fuel use	Fuel economy

Table 5.3 New Retail Truck Sales by Gross Vehicle Weight, 1970–2010^a (thousands)

Source:

Ward's Communication's, Motor Vehicle Facts and Figures 2010, Southfield, MI, 2010, p. 27, and annual; 2010: Ward's Communications, www.wardsauto.com. (Additional resources: www.wardsauto.com)

- ^c Data are not available.
- ^d 1987-2010.

^a Sales include domestic-sponsored imports. ^b Data for 1970 is based on new truck registrations.

The Census Bureau has discontinued the Vehicle Inventory and Use Survey; it was not conducted in 2007. The 2002 data remain the latest available.

Vehicle Inventory and Use Survey

The Vehicle Inventory and Use Survey (VIUS), which was formerly the Truck Inventory and Use Survey (TIUS), provides data on the physical and operational characteristics of the Na tion's truck population. It is based on a probability sample of private and commercial trucks registered (or licensed) in each state. In 1997, the survey was changed to the Vehicle Inventory and Use Survey due to future possibilities of including additional vehicle types. The 2002 VIUS, however, only includes trucks. Copies of the 2002 VIUS report or CD may be obtained by contacting the U.S. Bureau of the Census, Transportation Characteristics Surveys Branch (301) 457-2797. Internet site:

www.census.gov/svsd/www/tiusview.html

Since 1987, the survey has included minivans, vans, station wagons on truck chassis, and sport utility vehicles in addition to the bigger trucks. The 1977 and 1982 surveys did not include those vehicle types. The estimated number of trucks that were within the scope of the 2002 VIUS and registered in the United States as of July 1, 2002 was 85.2 million. These trucks were estimated to have been driven a total of 1,115 billion miles during 2002, an increase of 6.8% from 1997. The average annual miles traveled per truck was estimated at 13,100 miles.

In the 2002 V IUS, there are several ways to classify a truck by weight. The survey respondent was asked the av erage weight of the v ehicle or v ehicle-trailer combination when carry ing a typical payload; the empty weight (truck minus cargo) of the vehicle as it was usually operated; and the maximum gross weight at which the vehicle or vehicle-trailer combination was operated. The Census Bureau also collected information on the Gross Vehicle Weight Class of the vehicles (decoded from the vehicle identification number) and the registered weight of the vehicles from the State registration files. Some of these weights are only provided in categories, while others are exact weights. Since all these weights could be quite different for a single truck, the tabulations by weight can be quite confusing. In the tables presented here, the Gross Vehicle Weight Class was used.

Manufacturer's gross vehicle weight class	Number of trucks	Percentage of trucks	Average annual miles per truck	Harmonic mean fuel economy	Percentage of fuel use
1) 6,000 lbs and less	51,941,389	61.0%	11,882	17.6	42.7%
2) $6,001 - 10,000$ lbs	28,041,234	32.9%	12,684	14.3	30.5%
Light truck subtotal	79,982,623	93.9%	12,163	16.2	73.2%
3) 10,001 – 14,000 lbs	691,342	0.8%	14,094	10.5	1.1%
4) 14,001 – 16,000 lbs	290,980	0.3%	15,441	8.5	0.5%
5) 16,001 – 19,500 lbs	166,472	0.2%	11,645	7.9	0.3%
6) 19,501 – 26,000 lbs	1,709,574	2.0%	12,671	7.0	3.2%

Estimates are based on data provided on the following public use files: U.S. Department of Commerce, Bureau of the Census, Census of Transportation, Washington, DC, 1992 Truck Inventory and Use Survey, 1995; 1997 Vehicle Inventory and Use Survey, 2000, and 2002 Vehicle Inventory and Use Survey, 2005. (Additional resources: www.census.gov/svsd/www/tiusview.html)

Note: Based on average fuel economy as reported by respondent.

As expected, most light trucks travel within 50 miles of their home base and refuel at public stations. About sixty percent of heavy trucks travel over 50 miles from their home base and 36% of them refuel at central company-owned refueling stations.

TRANSPORTATION ENERGY DATA BOOK: EDITION 30-2011

The figure below shows the distribution of annual travel the two types of Class 7 and 8 vehicles–combination units (separate tractor and trailer) and single units (tractor and trailer on a single chassis). This information is for vehicles two years old or less and comes from the 2002 VIUS. Combination trucks, dominated by box-type trailers, display the greatest amount of annual travel of all heavy vehicle types, as is evidenced both by the range of annual use which is up to 250,000 miles per year, and the peaking that occurs in the 100,000 to 140,000-mile segments. Most of the single-unit trucks in the survey travel 40,000 miles per year or less.

Source:

U.S. Department of Commerce, Bureau of the Census, 2002 Vehicle Inventory and Use Survey, Microdata File on CD, 2005. (Additional resources: www.census.gov/svsd/www/tiusview.html)

Note: Heavy trucks (class 7 & 8) are greater than 26,000 pounds gross vehicle weight based on the manufacturer's rating.

The latest Vehicle Inventory and Use Survey asked truck owners if the truck had certain features as permanent equipment on the truck. Some of the features asked about were onboard computers, idle-reduction devices, navigational systems, and Internet access. Of the 2.3 million heavy trucks (class 7 & 8) in the United States, nearly 10% were equipped with onboard computers that had communication capabilities and another 5% had onboard computers without communication capabilities. Six percent of heavy trucks were equipped with idle-reducing technology. Navigational systems and Internet access were available in less than one percent of heavy trucks.

U.S. Department of Commerce, Bureau of the Census, 2002 Vehicle Inventory and User Survey, Microdata File on CD, 2005.

Note: Heavy trucks (class 7 & 8) are greater than 26,000 pounds gross vehicle weight based on the manufacturer's rating.

Fuel Economy Study for Class 8 Trucks

As part of a long-term study sponsored by the U.S. Department of Energy (DOE) Office of Vehicle Technologies (OVT), the Oak Ridge National Laboratory (ORNL) in conjunction with several industry partners has collected data and information related to heavy-truck operation in real-world highway environments. The primary objective of the project was to collect real-world performance and spatial data for long-haul operations of Class 8 tractor-trailers from a fleet engaged in normal freight operations. Six model year 2005 Class 8 trucks from the selected fleet, which operates within a large area of the country extending from the east coast to Mountain Time Zone and from Canada to the US-Mexican border, were instrumented and 60 channels of data were collected for over a year at a rate of 5 Hz (or 5 readings per second). Those channels included information such as instantaneous fuel rate, engine speed, gear ratio, vehicle speed, and other information read from the vehicle's databus; weather information (wind speed, precipitation, air temperature, etc.) gathered from an on-board weather station; spatial information (latitude, longitude, altitude) acquired from a GPS (Global Positioning System) device; and instantaneous tractor and trailer weight obtained from devices mounted on the six participating tractors and ten trailers. Three of the six instrumented tractors and five of the ten instrumented trailers were mounted with New Generation Single Wide-Based Tires and the others with regular dual tires. Over the duration of this phase of the project (just over a year) the six tractors traveled nearly 700,000 miles.

To find out more about this project, contact Oscar Franzese, franzeseo@ornl.gov, 865-946-1304. The final report on this project is available on-line at:

cta.ornl.gov/cta/Publications/Reports/ORNL_TM_2008-122.pdf.

The type of terrain a truck is traveling on can cause significant differences in fuel efficiency. This study (see page 5–13 for project description) shows fuel economy on severe upslopes is less than half that on flat terrain. On severe downslopes, the fuel economy was three times higher than on flat terrain.

	Average Fuel Efficiency (mpg)						
					Difference		
			Tractors	Tractors	between Dual		
	Share of Data	All	with Dual	with Single	and Single		
Type of Terrain	Records	Trucks	Tires	(wide) Tires	Tires (percent)		
Severe upslope (>4%)	0.7%	2.90	2.86	2.94	2.91%		
Mild upslope (1% to 4%)	13.2%	4.35	4.25	4.44	4.35%		
Flat terrain (1% to 1%)	72.4%	7.33	7.08	7.58	7.13%		
Mild downslope (-4% to -1%)	12.6%	15.11	14.64	15.57	6.36%		
Severe downslope (<-4%)	1.1%	23.5	21.82	25.3	15.97%		

Table 5.10Effect of Terrain on Class 8 Truck Fuel Economy

Source:

Capps, Gary, Oscar Franzese, Bill Knee, M.B. Lascurain, and Pedro Otaduy. *Class-8 Heavy Truck Duty Cycle Project Final Report*, ORNL/TM-2008/122, Oak Ridge National Laboratory, Oak Ridge, TN, December 2008.

5-14

Table 5.10 presents a distribution of distance traveled, fuel consumed, and fuel economy by speed and by type of tires for the vehicles participating in the project (see page 5-13 for project description). The speed bins are divided into 5-mile intervals, going from 0+ mph (i.e., speed > 0.00 mph) to 85 mph, while the four main columns of Table 5.10 are organized by the type of tires that were mounted on the tractor and trailers. The first row of the table contains information about fuel consumed while the vehicle was idling (i.e., the vehicle was static with the engine on) with the following rows presenting information about the distance traveled, fuel consumed, and fuel economy for each one of the speed intervals. The next-to-the-last row shows the totals for both traveled distances and fuel consumed as well as the overall fuel economy for each tire-combination category. The latter are then used to compute the percentage difference in terms of fuel economy from dual tire tractors and trailers, which is the most common tire setup for large trucks at the present time.

Table 5.11 Fuel Economy for Class 8 Trucks as Function of Speed and Tractor-Trailer Tire Combination

Source:

Capps, Gary, Oscar Franzese, Bill Knee, M.B. Lascurain, and Pedro Otaduy. Class-8 Heavy Truck Duty Cycle Project Final Report, ORNL/TM-2008/122, Oak Ridge National Laboratory, Oak Ridge, TN, December 2008.

Note: These data were not adjusted to account for the effects of terrain. The increase in fuel economy for speeds above 70 mph is likely due to the vehicle achieving high speeds while traveling down slope. Therefore, this increase in fuel economy is not expected to be characteristic of all travel at these higher speeds.

^a Total Fuel Consumed does not include fuel consumed while idling.

The fuel economy information presented in Table 5.10 is on the upper limits of today's large-truck fleets and is mostly a result of driver training and the extensive vehicle maintenance (including constant tire pressure) to which the fleet company participating in this project adheres. Nevertheless, the results of this extensive test indicate that there are substantial gains in terms of fuel economy for large trucks when single (wide) tires are used in combination with dual tires or alone (best case). Figure 5.3 shows the information from Table 5.10 in a graphical form (bars) and also displays for each speed bin the percentage of the total distance that is traveled at that speed (line). It is possible to observe that above 80% of the distance traveled by long-haul Class 8 trucks is done at speeds above 55 mph. Therefore, any gains in fuel economy of these types of trucks. Figure 5.3 shows that, except for the D-S combination within the 65+ to 70 mph, the combinations with all single (wide) tires perform better and, therefore, obtain the largest overall fuel economy.

Figure 5.3. Class 8 Truck Fuel Economy as a Function of Speed and Tractor-Trailer Tire Combination and Percentage of Total Distance Traveled as a Function of Speed

NOT ADJUSTED FOR TERRAIN: See note below.

Source:

Capps, Gary, Oscar Franzese, Bill Knee, M.B. Lascurain, and Pedro Otaduy. *Class-8 Heavy Truck Duty Cycle Project Final Report*, ORNL/TM-2008/122, Oak Ridge National Laboratory, Oak Ridge, TN, December 2008.

Note: D = Dual tire. S = Single (wide) tire.

These data were not adjusted to account for the effects of terrain. The increase in fuel economy for speeds above 70 mph is likely due to the vehicle achieving high speeds while traveling down slope. Therefore, this increase in fuel economy is not expected to be characteristic of all travel at these higher speeds.

This graph presents for each one of the four tire-combination categories the percent of total fuel that is consumed when traveling at different speeds (bars) as well as the average percent of fuel consumed for each speed bin (line). As opposed to Table 5.10, the total fuel consumed on this graph includes the fuel consumed while idling.

NOT ADJUSTED FOR TERRAIN: See note below.

Capps, Gary, Oscar Franzese, Bill Knee, M.B. Lascurain, and Pedro Otaduy. *Class-8 Heavy Truck Duty Cycle Project Final Report*, ORNL/TM-2008/122, Oak Ridge National Laboratory, Oak Ridge, TN, December 2008.

Note: D = Dual tire. S = Single (wide) tire.

These data were not adjusted to account for the effects of terrain. The increase in fuel economy for speeds above 70 mph is likely due to the vehicle achieving high speeds while traveling down slope. Therefore, this increase in fuel economy is not expected to be characteristic of all travel at these higher speeds.

A typical class 8 truck tractor weighs about 17,000 lbs. The powertrain is nearly a quarter of the weight (24%) while the truck body structure is 19%.

	Pounds	Share of Total
Wheels and tires	1,700	10%
Chassis/frame	2,040	12%
Drivetrain and suspension	2,890	17%
Misc. accessories/systems	3,060	18%
Truck body structure	3,230	19%
Powertrain	4,080	24%
Total	17,000	100%

Table 5.12Class 8 Truck Weight by Component

Source:

National Academy of Sciences, *Technologies and Approaches to Reducing the Fuel Consumption of Medium and Heavy-Duty Vehicles*, prepublication copy, March 2010, p. 5-42.

Notes:

- Powertrain includes engine and cooling system, transmission and accessories.
- Truck body structure includes cab-in-white, sleeper unit, hood and fairings, interior and glass.
- Miscellaneous accessories/systems include batteries, fuel system, and exhaust hardware.
- Drivetrain and suspension includes drive axles, steer axle, and suspension system.
- Chassis/frame includes frame rails and crossmembers, fifth wheel and brackets. Wheels and tires include a set of 10 aluminum wheels, plus tires.

The gross weight of a vehicle (GVW) is the weight of the empty vehicle plus the weight of the maximum payload that the vehicle was designed to carry. In cars and small light trucks, the difference between the empty weight of the vehicle and the GVW is not significantly different (1,000 to 1,500 lbs). The largest trucks and tractor-trailers, however, have a payload capacity share of 200%, which means they can carry 200% of their empty weight. The medium-sized trucks (truck classes 3-6) have payload capacity shares between 50% and 100%.

		Gross Vehicle Weight Range	Empty Vehicle Weight Range	Maximum Payload Capacity	Payload Capacity Share (Percent of Empty
Vehicle Description	Truck Class	(pounds)	(pounds)	(pounds)	Weight)
Cars		3,200-6,000	2,400-5,000	1,000	20%
Minivans, Small SUVs, Small Pick-Ups	1	4,000-2,400	3,200-4,500	1,500	33%
Large SUVs, Standard Pick- Ups	2a	6,001-8,500	4,500-6,000	2,500	40%
Large SUVs, Standard Pick- Ups	2b	8,501-10,000	5,000-6,300	3,700	60%
Utility Van, Multi- Purpose, Mini-Bus, Step Van	3	10,001-14,000	7,650-8,750	5,250	60%
City Delivery, Parcel Delivery, Large Walk-in, Bucket, Landscaping	4	14,001-16,000	7,650-8,750	7,250	80%
City Delivery, Parcel Delivery, Large Walk-in, Bucket	5	16,001-19,500	9,500-10,000	8,700	80%
City Delivery, School Bus, Large Walk-in, Bucket	6	19,501-26,000	11,500-14,500	11,500	80%
City Bus, Furniture, Refrigerated, Refuse, Fuel Tanker, Dump, Tow, Concrete, Fire Engine, Tractor-Trailer	7	26,001-33,000	11,500-14,500	18,500	125%
Refuse, Concrete, Furniture, City Bus, Tow, Fire Engine (straight trucks)	8a	33,001-80,000	20,000-26,000	54,000	200%
Tractor-Trailer: Van, Refrigerated, Bulk Tanker, Flat Bed (combination trucks)	8b	33,001-80,000	20,000-26,000	54,000	200%

 Table 5.13

 Gross Vehicle Weight vs. Empty Vehicle Weight

Source:

National Academy of Sciences, *Technologies and Approaches to Reducing the Fuel Consumption of Medium and Heavy-Duty Vehicles*, prepublication copy, March 2010, pp. 2-2 and 5-42.

According to weigh-in-motion data collected by fifteen states, the majority of 5-axle tractor-trailers on the road weigh between 33,000 and 73,000 lbs. Eleven percent of the tractor-trailers had weight recorded around 72,800 lbs and 10% around 68,300 lbs. Another 10% of tractor-trailers were on the lighter end of the scale – around 37,500 lbs. These data show that only a small percent of trucks on the road are near the maximum roadway gross vehicle weight of 80,000 lbs. Thus, most trucks are filling the trailer space to capacity (cubing-out) before they reach the maximum weight limit (weighing-out).

Note: Data are from these 15 States: California, Connecticut, Florida, Georgia, Hawaii, Iowa, Minnesota, Missouri, Montana, North Carolina, Oregon, Pennsylvania, South Dakota, Texas, and Washington.

Commodity Flow Survey

The Commodity Flow Survey (CFS) is designed to provide data on the flow of goods and materials by mode of transport. The 1993, 1997, 2002, and 2007 CFS are a continuation of statistics collected in the Commodity Transportation Survey from 1963 thr ough 1977, and incl ude major improvements in methodology, sample size, and scop e. T he 2007 CFS cov ers business establishments with p aid employees that are located in the Uni ted States and are classified using the North American Industry Classification System (NAICS) in m ining, manufacturing, wholesale trade, and se lect retail trade industries, namely, electronic shopping and m ail-order houses. Es tablishments classified in services, transportation, construction, and most retail industries are excluded from the survey. Farms, fisheries, foreign establishments, and most government-owned establishments are also excluded.^a

The 1993, 1997, 2002, and 2007 CFS differ from previous surveys in their greatly expanded coverage of intermodalism (i.e., shipments which travel by at least two different modes, such as rail and truck). Ea rlier surveys reported only the principal mode. R oute distance for each mode for each shipment was imputed using methodologies developed by Oak Ridge National Laboratory. Distance, in turn, was used to compute ton-mileage by mode of transport.

The data can be viewed at: www.bts.gov/publications/commodity_flow_survey.

^a Bureau of Transportation Statistics and U.S. Bureau of the Census, 2007 Economic Census, 2007 *Commodity Flow Survey*, December 2008.

Industries covered by the 2007 Commodity Flow Survey (CFS) shipped over 12 billion tons of goods worth over \$11 trillion. Compared to the 1997 CFS, the value of shipments is up 1.3% per year and tons shipped are up 1.6% per year. By value, intermodal shipments increased 4.7% per year from 1997 to 2007.

	Electric	687
	Biodiesel	610
	Hydrogen	58

Fuel type ab	brevi	ations are used throughout this chapter.
B20	=	20% biodiesel, 80% petroleum diesel
CNG	=	compressed natural gas
E85	=	85% ethanol, 15% gasoline
E95	=	95% ethanol, 5% gasoline
H_2	=	hydrogen
LNG	=	liquefied natural gas
LPG	=	liquefied petroleum gas
M85	=	85% methanol, 15% gasoline
M100	=	100% methanol

Alternative Fuels

The Energy Policy Act of 1992 defines alternative fuels and allows the U.S. Department of Energy (DOE) to add to the list of alternative fuels if the fuel is substantially nonpetroleum, yields substantial energy security benefits, and offers substantial environmental benefits. DOE currently recognizes the following as alternative fuels:

- methanol, ethanol, and other alcohols,
- blends of 85% or more of alcohol with gasoline,
- natural gas and liquid fuels domestically produced from natural gas,
- liquefied petroleum gas (propane),
- coal-derived liquid fuels,
- hydrogen,
- electricity,
- biodiesel (BIOO),
- fuels (other than alcohol) derived from biological materials,
- P-series.

Alternative Fuels & Advanced Vehicles Data Center

DOE established the Alternative Fuels Data Center (AFDC) in 1991 to support its work aimed at fulfilling the Alternative Motor Fuels Act directives. Since then, the AFDC has expanded its focus to include all advanced transportation fuels, vehicles, and technologies. It has been renamed the Alternative Fuels & Advanced Vehicles Data Center to reflect this broader scope. The AFDC is oper ated and managed by the National Renewable Energy Laboratory (NREL) in Golden, Colorado.

The purposes of the AFDC are:

- to gather and analyze information on the fuel consumption, emissions, operation, and durability of alternative fuel vehicles, and
- to provide unbiased, accurate information on alternative fuels and alternative fuel vehicles to government agencies, private industry, research institutions, and other interested organizations.

Much of the AFDC data can be obta ined through their Web site: **www.eere.energy.gov/afdc**. Several tables and graphs in this chapter contain statistics which were generated by the AFDC. Below are some links to specific areas of the AFDC Web site.

Alternative & Advanced Fuels - www.eere.energy.gov/afdc/fuels/index.htmlAlternative Fueling Station Locator - www.eere.energy.gov/afdc/fuels/stations_locator.htmlAlternative & Advanced Vehicles - www.eere.energy.gov/afdc/vehicles/index.htmlFleet Information - www.eere.energy.gov/afdc/fleets/index.htmlState & Federal Incentives & Laws - www.eere.energy.gov/afdc/incentives_laws.htmlData Analysis & Trends - www.eere.energy.gov/afdc/data/index.html

There are over 826,000 alternative fuel vehicles in the United States, not including flex-fuel E85 vehicles which operate mainly on gasoline. The E85 vehicles in this table are those believed to be regularly fueled with E85.

Year	LPG	CNG	LNG	M85	M100	E85 ^b	E95	Electricity ^c	Hydrogen	Total

 Table 6.1

 Estimates of Alternative Fuel Vehicles in Use^a, 1995–2009

Source:

^c Excludes HEVs.

U. S. Department of Energy, Energy Information Administration, Alternatives to Traditional Transportation Fuels, 2009, Washington, DC, May 2011, Table VI. 1995-2006, Annual Energy Review, Table 10.4. Estimated Number of Alternative-Fueled Vehicles in Use and Replacement Fuel Consumption. (Additional resources: www.eia.doe.gov/emeu/aer/renew.html and www.eere.energy.gov/afdc/data/vehicles.html)

^a Vehicles in Use represent accumulated acquisitions, less retirements, as of the end of each calendar year. They do not include concept and demonstration vehicles.

^b Includes only those E85 vehicles believed to be used as alternative-fuels vehicles (AFVs), primarily fleetoperated vehicles; excludes other vehicles with E85-fueling capability. In 1997, some vehicle manufacturers began including E85-fueling capability in certain model lines of vehicles. For 2007, the Energy Information Administration (EIA) estimates that the number of E85 vehicles that are capable of operating on E85, motor gasoline, or both, is ab out 7.1 million. Man y of these AFVs are sold and used as traditional gasoline-powered vehicles.

Trollybus, heavy rail, and light rail use nearly all alternative fuels. However, the 33.5% of buses using alternative fuels replace a lot of traditional fuel use. Rail transit vehicles have the highest average age.

		Percent	Number
	Average	Powered by	Of
Mode	Age	Alternative Fuels	Vehicles
Bus	7.5	33.5%	64,832
Commuter Rail	20.5	11.3%	6,941

 Hybrid Electric Vehicles Available by Manufacturer, Model Year 2011

Source:

U.S. Department of Energy, National Alternative Fuels Data Center, Web site, www.afdc.energy.gov/afdc/vehicles/index.html, February 2011 (Additional resources: www.eere.energy.gov/afdc/progs vehicles search.php)

Note: LEV = low emission vehicle; ILEV = inherently low emission vehicle; ULEV = ultra low emission vehicle; ZEV = zero e mission vehicle; TLEV = transitional low emission vehicle; SULEV = super ultra low emission vehicle; AT-PZEV = avanced technology - partial zero emissions vehicle. See Chapter 12 for details on emissions.

^a NiMH = Nick el-Metal Hydride; PbA = Lead-Acid; Mild hybrid = A vehicle that shuts down the engine when coasting, breaking or stopped while continuing to power accessories. There is however, no electric drivetrain like that found on a full hybrid vehicle.

This list includes public and private refuel sites; therefore, not all of these sites are available to the public.

www.eere.energy.gov/afdc/fuels/stations_counts.html, February 2011.

Clean Cities is a locally-based government/industry partnership, coordinated by the U.S. Department of Energy to expand the use of alternatives to gasoline and diesel fuel. By combining the decision-making with voluntary action by partners, the "grass-roots" approach of Clean Cities departs from traditional "top-down" Federal programs.

The Vehicle Technologies Program is administered by the Department of Energy's Office of Energy Efficiency and R enewable Energy. The mission of this program is to dev elop more energy efficient and environmentally friendly highway transportation technologies that enable America to use less petroleum. The long-term aim is to dev elop "leap frog" technologies that will provide Americans with greater freedom of mobility and energy security, with lower costs and lower impacts on the environment. For additional information about the Vehicle Technologies Program, visit the W eb site listed above.

Hydrogen Analysis Resource Center

hydrogen.pnl.gov/

The Hydrogen Analysis Resource Center was developed to provide reliable data and information for hydrogen-related analytical activities. The Center's Web site includes:

- Hydrogen Data Book contains a wide range of factual information on hydrogen and fuel cells. hydrogen.pnl.gov/cocoon/morf/hydrogen/article/103.
- Hydrogen Glossary contains a cronyms and terms used commonly in the Hydrog en Analysis Resource Center.
- Related Sites provides links to other sites with data relevant to hydrogen and fuel cell analysis.
- Guidelines and As sumptions for DOE Hy drogen Program Analysis contains guidelines for conducting analysis (under development) and assumptions.
- Calculator Tools provides tools to perform conversions of hydrogen and other calculations relevant to hydrogen and fuel cells.
- Analysis Tools provides links to models and other tools relevant to hydrogen and fuel cells, such as H2A, GREET, PSAT, VISION, MOVES, and other transportation and energy models.

Table 7.4	Federal government vehicles, FY 2010	659,125
	Light trucks (<8,500 lbs. GVW)	281,116
	Cars and other passenger vehicles	246,330
	Medium trucks (8,500–26,000 lbs. GVW)	89,253
	Heavy trucks (>26,000 lbs. GVW)	32,760
	Buses and ambulances	9,666

Vehicles in fleets of 15 or more are counted as fleet vehicles, as well as vehicles in fleets where five or more vehicles are purchased annually. Historical data on fleets are not available due to definitional changes of what constitutes a fleet.

Source:

Bobit Publishing Company, Automotive Fleet Research Department, Automotive Fleet Factbook 2010, Redondo Beach, CA, 2011. (Additional resources: www.fleet-central.com)

^a Taxi category includes vans.

^b Rental category includes vans and sports utility vehicles under cars, not trucks.

^c Fleets of 15 or more in operation or 5 or more fleet vehicles purchased annually.

TRANSPORTATION ENERGY DATA BOOK: EDITION 30-2011

Rental companies made the largest light fleet vehicle registrations in 2009 buying over 1.1 million vehicles, most of them cars (64.4%). Only 31.7% of the new commercial fleet registrations were cars.

	Commercial	Rental	Government	Total
Cars	31.7%	64.4%	41.8%	53.2%
Pickup trucks	28.2%	43.6%	25.7%	12.6%
Vans	20.7%	13.9%	17.5%	16.1%
Sport utility vehicles	19.4%	18.1%	15.0%	18.1%
Total	456,317	1,100,520	215,660	1,772,497

 ^a Public assistance monies are included in reported income. Data for those reporting income.
 ^b Percentages may not sum to totals due to rounding.
 ^c Includes alcoholic beverages.
 ^d Includes personal care, re ading, education, tobacco and smoking supplies, cash contributions, and miscellaneous items.

^e The term household refers to a "consumer unit," which is defined differently than households on Table 8.1.

Household vehicle ownership shows a dramatic increase from 1960 to 1990. In 1960, nearly 79% of households owned less than two vehicles; by 1990, it declined to 45%. Census data prior to 1990 indicated that the majority of households owned one vehicle; in 1990 that changed to two vehicles.

Table 8.4 Household Vehicle Ownership, 1960–2009 Census (percentage)							
	No vehicles	One vehicle	Two vehicles	Three or More vehicles			
1960	21.53%	56.94%	19.00%	2.53%			
1970	17.47%	47.71%	29.32%	5.51%

2009 National Household Travel Survey Daily Trip Data

The Department of Transportation (DOT) collected data on daily trips in 1969, 1977, 1983, 1990 and 1995 via the Nationwide Personal Transportation Survey (NPTS). For 2001, the DOT combined the collection of long trip and daily trip data into one survey – the 2001 Na tional Travel Household Travel Survey (NHTS). The long trip data were not included in the 2009 NHTS.

The NHTS is the nation's inventory of daily travel. The survey includes demographic characteristics of households, people, vehicles, and detailed information on daily travel for all purposes by all modes. NHTS survey data are collected from a sample of U.S. households and expanded to provide national estimates of trips and miles by travel mode, trip purpose, and a host of household attributes.

The NHTS was designed to continue the NPTS series, but as with all data surveys, caution should be used when comparing statistics from one s urvey to another due to changes in terminology, survey procedures, and target population. The 2001 and 2009 surveys collected data on trips of children under 5 years of age, while the previous NPTS did not. Improved methodologies first used in the collection of trip information in the 1995 NPTS make it difficult to compare these data with past NPTS survey data. Thus, the 1990 NPTS trip data have been adjusted to make it comparable with the later surveys.

Table 8.5 Demographic Statistics from the 1969, 1977, 1983, 1990, 1995 NPTS and 2001, 2009 NHTS

	1969	1977	1983	1990	1995	2001	2009	Percent change 1969–2009
Persons per household	3.16	2.83	2.69	2.56	2.63	2.58	2.50	-21%
Vehicles per household	1.16	1.59	1.68	1.77	1.78	1.89	1.87	61%
Workers per household	1.21	1.23	1.21	1.27	1.33	1.35	1.34	11%
Licensed drivers per household	1.65	1.69	1.72	1.75	1.78	1.77	1.88	14%
Vehicles per worker	0.96	1.29	1.39	1.40	1.34	1.39	1.40	46%
Vehicles per licensed driver	0.70	0.94	0.98	1.01	1.00	1.06	1.00	42%
Average vehicle trip length (miles)	8.89	8.34	7.90	8.98	9.06	9.87	9.72	9%

Sources:

U.S. Department of Transportation, Federal Highway Administration, 1990 Nationwide Personal Transportation Survey: Summary of Travel Trends, FHWA-PL-92-027, Washington, DC, March 1992, Table 2. Data for 1995, 2001 and 2009 were generated from the Internet site nhts.ornl.gov. (Additional resources: www.fhwa.dot.gov)

Note: Average vehicle trip length for 1990 and 1995 is calculated using only those records with trip mileage information present. The 1969 survey does not include pickups and other light trucks as household vehicles.

Due to methodology improvements in collecting trip information, the 2001 and 1995 data should be compared only to the 1990 adjusted data. The original 1990 data are comparable to all previous surveys; however, comparisons should always be made with caution because of differing survey methodologies.

	Journey-to-work ^a	All trips
Average	e annual vehicle-miles per ho	usehold
1969	4,183	12,423

Sources:

U.S. Department of Transportation, Federal Highway Administration, *1990 Nationwide Personal Transportation Survey: Summary of Travel Trends*, FHWA-PL-92-027, Washington, DC, March 1992, Table 7. 1 990 adjusted data - Oak Ri dge National Laboratory, Oak Ridge, TN, August 1998. 1995 NPTS, 2001, 2009 NHTS data were generated from the Internet site *nhts.ornl.gov*. (Additional resources: www.fhwa.dot.gov, www-cta.ornl.gov/npts)

^a It is believed that the methodology changes in the 1995 NP TS did not affect journey-to-work trips; therefore, no adjustment is necessary.

In 2001 and 2009 vehicle-miles traveled (vmt) for a three-person household is around 28,000 miles. The number of drivers in a household makes a big difference in vmt, as does the presence of children in the household. Households with children have more than double the vmt of households without children.

Table 8.8Trip Statistics by Trip Purpose, 2001 and 2009 NHTS

Source:

Generated from the National Household Travel Survey Internet site: nhts.ornl.gov.

Note: The "All" category for average trip length and duration includes records for which trip purpose was not identified.

While car occupancy stayed nearly constant from 1995 to 2009, most other vehicle types showed increased occupancy. Vans and sport utility vehicles have higher vehicle occupancies than cars.

Figure 8.1. Average Vehicle Occupancy by Vehicle Type, 1995 NPTS and 2009 NHTS

Sources:

U.S. Department of Transportation, Federal Highway Administration, 1995 Nationwide Personal Transportation Survey, Washington, DC, 1997, and 2009 National Household Travel Survey, Washington, DC. (Additional resources: www.fhwa.dot.gov, nhts.ornl.gov) The average vehicle occupancy, calculated as person-miles per vehicle-mile, is highest for social and recreational purposes. The highest vehicle occupancy levels for all purposes were in 1977. The increase in number of vehicles per household and the decrease in average household size could have contributed to the decline since then.

R ichard Kuzmyak, COMSIS Corporation, *Personal Travel in the United States, Volume 1: 1983–84 Nationwide Personal Travel Study*, prepared for the U.S. Department of Transportation, Washington, DC, August 1986, Table 4-22, p.4-21. 1990: Generated from the 1990 Nationwide Personal Transportation Study Public Use Tape, March 1992. 1995, 2001 and 2009: Generated from the 2009 NHTS datasets, version 2, Febru ary 2011. (Addition al resources: nhts.ornl.gov)

Note: Data include all household vehicles, and have been rounded to the nearest hundred.

Historically, the data from the Nationwide Personal Transportation Survey (NPTS) are based on estimates reported by survey respondents. For the 1995 NPTS and the 2001 National Household Travel Survey (NHTS), odometer data were also collected. The 1995 data indicate that respondents overestimate the number of miles they drive in a year, but the 2001 data do not show that same trend.

Vehicle age	1995	1995	2001	2001
(years)	self-reported	odometer	self-reported	odometer

According to the U.S. Census data, the percentage of workers who car pooled has dropped from 19.7% in 1980 to 10% in 2009. The percent of workers using public transit declined from 6.4% to 5.3% in the ten-year period between 1980 and 1990, but stayed relatively the same from 1990 to 2009 (5.0%). The average travel time increased by 3.5 minutes from 1980 to 2009. The American Community Survey (ACS) now collects journey-to-work data on an annual basis. It shows the average commute time rising to 25.2 minutes in 2009.

U.S. Department of Transportation, Federal Highway Administration, 2009 National Household Travel Survey Web site: nhts.ornl.gov.

In 2009 only data on daily trips were collected in the NHTS. The 2001 data are still the latest available on longdistance trips.

Long Distance Trips – 2001 National Household Travel Survey

The 2001 National Household Travel Survey (NHTS) collected data on long-distance trips as well as everyday travel. The everyday travel data is a continuation of the Nationwide Personal Transportation Survey (NPTS), while the long-distance travel data is a continuation of the American Travel Survey (ATS) which was collected in 1977 and 1985. The survey collected trip-related data such as mode of transportation, duration, distance and purpose of trip. It also gathered demographic, geographic, and economic data for analysis purposes.

A long-distance trip is defined as a trip of 50 miles or more, one-way. Long-trip data from the 2001 NHTS were released in the summer of 2004. For a dditional information about the 2001 NHTS data, contact the Bureau of Transportation Statistics at 202-366-3282 or v isit the following Internet site: www.bts.gov/programs/national_household_travel_survey.

1970–76 Energy Use - Department of Transportation, Civil Aeronautics Board, *Fuel Cost and Consumption*, Washington, DC, 1981, and annual.

^a Data are for all U.S. air carriers reporting on Form 41.

^b Available seats per aircraft is calculated as the ratio of available seat-miles to revenue aircraft-miles.

^c Passenger load factor is calculated as the ratio of revenue passenger-miles to available seat-miles for scheduled and nonscheduled services.

^d Energy use includes fuel purchased abroad for international flights.

General aviation includes: (1) aircraft operating under general operating and flight rules; (2) not-for-hire airplanes with a seating capacity of 20 or more or a maximum payload capacity of 6,000 lbs. or more; (3) rotorcraft external load operations; (4) on-demand and commuter operations not covered under Federal Aviation Regulations Part 121; and (5) agricultural aircraft operations.

^b Includes rotorcraft.

^a Active fixed-wing general aviation aircraft only.

In the early seventies, domestic waterborne commerce accounted for over 60% of total tonnage, but by 1994 foreign tonnage grew to more than half of all waterborne tonnage. Total foreign and domestic tons shipped were about 2.2 billion tons in 2009, down from a peak of 2.59 billion tons in 2006.

U.S. Department of the Army, Corps of Engineers, *Waterborne Commerce of the United States, Calendar Year 2009*, New Orleans, Louisiana, 2010, Table 1-1. (Additional resources: www.ndc.iwr.usace.army.mil)

^b All movements between U.S. ports, continental and noncontiguous, and on the inland rivers, canals, and connecting channels of the United States, Puerto Rico, and the Virgin Islands, excluding the Panama Canal. Beginning in 1996, fish was excluded for internal and intra port domestic traffic.

^a All movements between the United States and foreign countries and between Puerto Rico and the Virgin Islands and foreign countries are classified as foreign trade.

The U.S. Army Corps of Engineers Navigation Data Center collects a wealth of waterborne commerce data. Energy use data, however, have never been collected as part of this effort. The energy use data collected by the Energy Information Administration (EIA) on vessel bunkering was formerly displayed on this table. The EIA data include different uses of fuel, not just fuel for domestic waterborne commerce; therefore it was misleading to display those data together.

Source:

U.S. Environmental Protection Agency, NONROAD2008a model, downloadable file from http://www.epa.gov/otaq/nonrdmdl.htm.

The Interstate Commerce Commission designates Class I railroads on the basis of annual gross revenues. In 2009, seven railroads were given this designation. The number of railroads designated as Class I has changed considerably in the last 30 years; in 1976 there were 52 railroads given Class I designation. For detailed information by railroad, see the 2010 Vehicle Technologies Market Report at url http://www1.eere.energy.gov/vehiclesandfuels/pdfs/2010_vt_market_rpt.pdf.

	Revenue ton-miles

Table 9.7 Class I Railroad Freight Systems in the United States Ranked by Revenue Ton-Miles, 2009

Source:

Association of American Railroads, *Railroad Facts*, 2010 Edition, Washington, DC, November 2010, p. 66. (Additional resources: www.aar.org)

Revenue ton-miles for Class I freight railroads was over 1.7 trillion in 2009. Though there are many regional and local freight railroads, the Class I freight railroads accounted for 93% of the railroad industry's freight revenue in 2009 and 67% of the industry's mileage operated. The energy intensity of Class I railroads hit an all-time low of 291 btu/ton-mile in 2009.

						Average		Energy	Energ

Table 9.8Summary Statistics for Class I Freight Railroads, 1970–2009

Source:

Association of American Railroads, *Railroad Facts*, 2010 Edition, Washington, DC, November 2010, pp. 27, 28, 33, 34, 36, 49, 52, 61. (Additional resources: www.aar.org)

^a Does not include self-powered units.

^b Does not include private or shipper-owned cars. Beginning in 2001, Canadian-owned U.S. railroads are excluded.

^c Tons originated is a more accurate representation of total tonnage than revenue tons. Revenue tons often produces double-counting of loads switched between rail companies.

^d Data represent total locomotives used in freight and passenger service. Separate estimates are not available.

According to the 2007 Commodity Flow Survey, 7% of all freight ton-miles are rail intermodal shipments (truck/rail or rail/water). See Table 5.15 for details. The number of trailers and containers moved by railroads has increased almost six-fold from 1965 to 2009. Containerization has increased in the last two decades, evidenced by the 258% increase in the number of containers from 1988 to 2009. The number of trailers moved by rail, however, fell to an all-time low in 2009.

1994–2009 - Number of l ocomotives in service, number of passenger cars, train-miles, car-miles, revenue passenger-miles, and average trip length - Association of American Railroads, *Railroad Facts*, 2010 Edition, Washington, DC, 2010, p. 77.

Energy use - Personal communication with the Amtrak, Washington, DC. (Additional resources: www.amtrak.com, www.aar.org)

^b Energy use for 1994 on is not directly comparable to earlier years. Some commuter rail energy use may have been inadvertently included in earlier years.

^a Data are not available.

Commuter rail, which is also known as regional rail or suburban rail, is long-haul rail passenger service operating between metropolitan and suburban areas, whether within or across state lines. Commuter rail lines usually have reduced fares for multiple rides and commutation tickets for regular, recurring riders.

	Number of passenger	Vehicle- miles	Passenger trips	Passenger- miles	Average trip length	Energy intensity (Btu/passenger-	Energy use (trillion

 Table 9.11

 Summary Statistics for Commuter Rail Operations, 1984–2009

Source:

American Public Transportation Association, 2011 Public Transportation Fact Book, Washington, DC, April 2011, Tables 5, 6, 8, and 9. (Additional resources: www.apta.com)

This table on transit rail operations includes data on light rail and heavy rail systems. Light rail vehicles are usually single vehicles driven electrically with power drawn from overhead wires. Heavy rail is characterized by high speed and rapid acceleration of rail cars operating on a separate right-of-way.

	Number of	Vehicle-	Passenger	Passenger-	Average trip	Energy intensity	
	passenger	miles	trips	miles	length	(Btu/passenger-	Energy use

Table 9.12Summary Statistics for Rail Transit Operations, 1970–2009^a

Sources:

American Public Transportation Association, 2011 Public Transportation Fact Book, Washington, DC, April 2011, Table 27. (Additional resources: www.apta.com)

Energy use - See Appendix A for Rail Transit Energy Use.

^a Heavy rail and light rail. Series not continuous between 1983 and 1984 because of a change in data source by the American Public Transit Association (APTA). Beginning in 1984, data provided by APTA are taken from mandatory reports filed with the Urban Mass Transit Administration (UMTA). Data for prior years were provided on a voluntary basis by APTA members and expanded statistically.

^b 1970–79 data represents total passenger rides; after 1979, data represents unlinked passenger trips.

^c Estimated for years 1970–76 based on an average trip length of 5.8 miles.

^d Calculated as the ratio of passenger-miles to passenger trips.

^e Large system-to-system variations exist within this category.

^f Data are not available.

^g Average annual percentage change is calculated for years 1980–2009.

The Transportation Services Index (TSI) was created by the U.S. Department of Transportation Bureau of Transportation Statistics (BTS). It is an index that measures the movement of freight and passengers. The Freight TSI consists of:

- for-hire trucking (parcel services are not included);
- freight railroad services (including rail-based intermodal shipments such as containers on flat cars); inland waterway traffic;
- pipeline movements (including principally petroleum and petroleum products and natural gas);
- and air freight.

The index does not include international or coastal steamship movements, private trucking, courier services, or the United States Postal Services.

The index does not include intercity bus, sightseeing services, taxi service, private automobile usage, or bicycling and other nonmotorized means of transportation.

Until 2007, gasoline prices in China were, on average, less than the United States. Since then, the United States prices are the lowest of these listed countries. Those in France, the United Kingdom, and Germany paid, on average, more than six dollars per gallon.

Though the cost of crude oil certainly influences the price of gasoline, it is not the only factor which determines the price at the pump. Processing cost, transportation cost, and taxes also play a major part of the cost of a gallon of gasoline. The average price of a barrel of crude oil (in constant 2010 dollars) increased by 114% from 2000 to 2010, while the average price of a gallon of gasoline increased 43% in this same time period.

^a All gasohol blends are taxed at the same rate.

^b Includes benzol, benzene, naphtha, and other liquids used as a motor fuel.

These states have laws and incentives for alternative fuels production and/or use.

^a Includes Clean Fuel Initiatives and Pollution Prevention.

The average price of a new car in 2009 (\$23,186) was very close to the average price in 1916 (\$21,272) when adjusted for inflation. Average new car prices were at their lowest in 1940 (\$11,898). Since 1914 the highest average price was in the year 1998 (\$26,803).

Table 10.11Average Price of a New Car, 1906–2009

Sources:

Compiled by Jacob Ward, Vehicle Technologies Program, U.S. Department of Energy, from the following sources.
 Raff, D.M.G. & T rajtenberg, M. (1995), "Quality-Adjusted Prices for the American Automobile Industry: 1906-1940," National Bureau of Economic Research, Inc.; Gordon, R.J. (1990), *The Measurement of Durable Goods Prices*, National Bureau of Economic Research, Inc.; and U.S. Department of Commerce, Bureau of Economic Analysis (2010), National Income and Product Accounts.

Note: Estimations were used for years 1941-1946.

In current dollars, import cars, on average, were less expensive than domestic cars until 1982. Since then, import prices have almost tripled, while domestic prices have more than doubled (current dollars).

Source:

U.S. Department of Commerce, Bureau of Economic Analysis, *National Income and Product Accounts*, underlying detail estimates for Motor Vehicle Output, Washington, DC, 2011. (A dditional resources: www.stat-usa.gov)

^a Includes transplants.

^b Adjusted by the Consumer Price Inflation Index.

The total cost of operating a car is the sum of the fixed cost (depreciation, insurance, finance charge, and license fee) and the variable cost (gas and oil, tires, and maintenance), which is related to the amount of travel. The gas and oil share of total cost was 15.4% in 2010.

	Constant 20	10 dollars per 10,	000 miles ^a	Total cost per mile ^b (constant	Percentage gas and oil of total

^a Not seasonally adjusted.

The total number of employees involved in the manufacture of motor vehicles decreased by almost 56% from 1990 to 2010 and by about 64% for those involved in the manufacture of motor vehicle parts. Beginning in 2008, the share of production workers fell below 80% for manufacturers of both vehicles and parts.

Source:

U.S. Department of Energy, Energy Information Administration, *International Energy Outlook 2010*, Washington, DC, July 2010, Tables A10 and A11. (Additional resources: www.eia.doe.gov)

^a OECD is the Organization for Economic Cooperation and Development. See Glossary for included countries.

Global Warming Potentials (GWP) were developed to allow comparison of the ability of each greenhouse gas to trap heat in the atmosphere relative to carbon dioxide. Extensive research has been performed and it has been discovered that the effects of various gases on global warming are too complex to be precisely summarized by a single number. Further understanding of the subject also causes frequent changes to estimates. Despite that, the scientific community has developed approximations, the latest of which are shown below. Most analysts use the 100-year time horizon.

Table 11.2
Numerical Estimates of Global Warming Potentials Compared with Carbon Dioxide
(kilogram of gas per kilogram of carbon dioxide)

	Lifetime	Global warming potential direct effect for time horizons of		
Gas	(years)	20 years	100 years	500 years

Solomon, S. et al., "Technical Summary," in *Climate Change 2007: The Physical Science Basis*, Contribution of Working Group I to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change, Cambridge University Press, Cambridge, United Kingdom and New York, NY, USA, 2007.

Note: The typical uncertainty for global warming potentials is estimated by the Intergovernmental Panel on Climate Change \pm 35 percent.

^a No single lifetime can be defined for carbon dioxide due to different rates of uptake by different removal processes.

^b Hydrofluorocarbons

^c Perfluorocarbons

Carbon dioxide emissions in 2009 were 8% higher than in 1990. Carbon dioxide accounts for the majority of greenhouse gases.

Source:

U.S. Department of Energy, Energy Information Administration, *Emissions of Greenhouse Gases in the United States*, 2009, Washington, DC, March 31, 2011, Table 1. (Additional resources: www.eia.doe.gov)

Note: This greenhouse gas emissions inventory includes two "adjustments to energy consumption" which make the data different from Table 11.5. The adjustments are as follows:

- (1) Emissions from U.S. Territories are included.
- (2) International bunker fuels and military bunker fuels are excluded from the U.S. total.

^a Carbon dioxide equivalents are computed by multiplying the weight of the gas being measured by its estimated Global Warming Potential (See Table 11.2).

^b GWP = Gl obal warming potential. In cludes HFC-hydrofluorocarbons; PFC-perfluorocarbons; and SF₆-sulfur hexaflouride.

Though the transportation sector accounts for the largest share of carbon dioxide emissions, the industrial sector accounts for the largest share of total greenhouse gas emissions.

					Transportation	
Greenhouse gas and source	Residential	Commercial	Industrial	Transportation	Share of Total	Total

Table 11.4 Total U.S. Greenhouse Emissions by End-Use Sector, 2009 (million metric tonnes carbon dioxide equivalent^a)

Source:

U.S. Department of Energy, Energy Information Administration, *Emissions of Greenhouse Gases in the United States*, 2009, Washington, DC, March 31, 2011, and annual. (Additional resources: www.eia.doe.gov)

Note: This greenhouse gas emissions inventory includes two "adjustments to energy consumption" which make the data different from Table 11.5. The adjustments are as follows:

- (1) Emissions from U.S. Territories are included.
- (2) International bunker fuels and military bunker fuels are excluded from the U.S. total.

^a Carbon dioxide equivalents are computed by multiplying the weight of the gas being measured by its estimated Global Warming Potential (See Table 11.2).

Gases which contain carbon can be measured in terms of the full molecular weight of the gas or just in terms of their carbon content. This table presents carbon dioxide gas. The ratio of the weight of carbon to carbon dioxide is 0.2727. The transportation sector accounts for approximately one-third of carbon emissions.

Table 11.5

Note: Emissions from U.S. Territories are not included. International bunker fuels and military bunker fuels are included in these data.

^a Includes energy from petroleum, coal, and natural gas. Electric utility emissions are distributed across consumption sectors.

Most U.S. transportation sector carbon dioxide emissions come from petroleum fuels (98%). Motor gasoline has been responsible for about 60% of U.S. carbon dioxide emissions over the last twenty years.

The Greenhouse Gases, Regulated Emissions, and Energy Use in Transportation (GREET) Model

http://www.transportation.anl.gov/modeling_simulation/GREET/

Sponsored by the U.S. Department of Energy's Office of Energy Efficiency and Renewable Energy (EERE), Arg onne has dev eloped a full life-cycle model called GREET (<u>G</u>reenhouse gases, <u>Regulated Emissions</u>, and <u>E</u>nergy use in <u>T</u> ransportation). It allows researchers and analysts to evaluate energy and emission impacts of various vehicle and fuel combinations on a full fuel-cycle/vehicle-cycle basis. The first version of GREET was released in 1996. Since then, Argonne has continued to update and expand the model. The most recent GREET versions are GREET 1.8c.0 version for fuel-cycle analysis and GREET 2.7 version for vehicle-cycle analysis.

For a given vehicle and fuel system, GREET separately calculates the following:

- Consumption of total energy (energy in non-renewable and renewable sources), fossil fuels (petroleum, natural gas, and coal together), petroleum, coal and natural gas.
- Emissions of CO₂-equivalent greenhouse gases primarily carbon diox ide (CO₂), methane (CH₄), and nitrous oxide (N₂O).

• Emissions of six criteria pollutants: volatile organic compounds (VOCs), carbon monoxide (CO), nitrogen oxide (NOx), particulate matter with size smaller than 10 micron (PM₁₀), particulate matter with size smaller than 2.5 micron (PM_{2.5}),and sulfur oxides (SOx).

GREET includes more than 100 fuel production pathways and more than 80 vehicle/fuel systems. These vehicle/fuel systems cover all major vehicle technologies in the market and R&D arena:

- Conventional spark-ignition (SI) engines
- Direct-injection, SI engines
- Direct injection, compression-ignition (CI) engines
- Grid-independent hybrid electric vehicles (both SI and CI)
- Grid-connected (or plug-in) hybrid electric vehicles (both SI and CI)
- Battery-powered electric vehicles
- Fuel-cell vehicles

Figure 11.2. GREET Model Feedstocks and Fuels

To address technology improvements over time, GREET simulates vehicle/fuel systems over the period from 1990 to 2035, in five-year intervals.

For additional information about the GREET model, see the GREET Web site, or contact:

Michael Q. Wang Argonne National Laboratory 9700 South Cass Avenue, ES/362 Argonne, IL 60439-4815 phone: 630-252-2819 fax: 630-252-3443 email: mqwang@anl.gov

These are results from the latest GREET model (see preceding pages for description). California's (CA) grid mix was chosen due to the high renewable energy mix in that state. While in contrast, West Virginia's (WV) grid mix is primarily coal. Both of these are compared against the average U.S. grid mix for various vehicle technologies.

Figure 11.3. Well-to-Wheel Emissions for Various Fuels and Vehicle Technologies

Source: Argonne National Laboratory, GREET Model 1.8d.1.

Note: H2 = hydrogen; High-T = high-temperature.

11-11

Carbon Footprint

The carbon footprint measures a vehicle's impact on climate change in tons of carbon dioxide (CO_2) emitted annually. The following three tables show the carbon footprint for various vehicle classes. The sales-weighted average fuel economy rating for each vehicle class, based on 45% highway and 55% city driving, is us ed to d etermine the av erage annual carbon footprint for vehicles in the class. An estimate of 15,000 annual miles is used for each vehicle class and for each year in the series. The equation to calculate carbon footprint uses results of the GREET model version 1.8.

CarbonFootprint =
$$\left(CO_2 \times LHV \times \frac{AnnualMiles}{CombinedMPG}\right) + \left(CH_4 + N_2O\right) \times AnnualMiles$$

where:

 $CO_2 = (Tailpipe CO_2 + Upstream Greenhouse Gases) in grams per million Btu$

LHV = Lower (or net) Heating Value in million Btu per gallon

 $CH_4 = Tailpipe CO_2 equivalent$ methane in grams per mile

 N_2O = Tailpipe <u>CO₂ equivalent</u> nitrous oxide in grams per mile

The carbon footprint for all classifications of cars declined between 1975 and 2010. Midsize cars have experienced the greatest reduction in carbon footprint with a decrease of almost 59%.

Average Annual Carbon Footprint by Vehicle Classification, 1975 and 2010^a (short tons of CO₂)

Source:

Calculated using fuel economy from the U.S. Environmental Protection Agency, *Light-Duty Automotive Technology, Carbon Dioxide Emissions, and Fuel Economy Trends: 1975 Through 2010*, November 2010. See page 11-10 for details.

^c Not applicable.

^a Annual carbon footprint is based on 15,000 miles of annual driving.

^b Data are not available.

The amount of carbon dioxide released into the atmosphere by a vehicle is primarily determined by the carbon content of the fuel. However, there is a small portion of the fuel that is not oxidized into carbon dioxide when the fuel is burned. The Environmental Protection Agency (EPA) has published information on carbon dioxide emissions from gasoline and diesel which takes the oxidation factor into account and is based on the carbon content used in EPA's fuel economy analyses. The other fuels listed come from the Energy Information Administration.

	Grams per gallon	Kilograms per gallon	Pounds per gallon
Gasoline	8,788	8.8	19.4
Diesel	10,084	10.1	22.2
LPG	5,805	5.8	12.8
Propane	5,760	5.8	12.7

12-2

TRANSPORTATION ENERGY DATA BOOK: EDITION 30-2011

The transportation sector accounted for more than 73% of the nation's carbon monoxide (CO) emissions in 2008. Highway vehicles are by far the source of the greatest amount of CO. For details on the highway emissions of CO, see Table 12.3.

Note: The latest available data are 2008.

^a The sums of subcategories may not equal total due to rounding.

Though gasoline-powered light vehicles continue to be responsible for the majority of carbon monoxide emissions from highway vehicles, the total pollution from light vehicles in 2005 is about a third of what it was in 1970. This is despite the fact that there were many more light vehicles on the road in 2005.

EMISSION STANDARDS

The U.S. Env ironmental Protection Agency (EPA) regulates emissions from mobile sources including vehicles, engines, and motorized equipment that produce exhaust and evaporative emissions. Mobile sources contribute to four main air pollutants: carbon monoxide, hydrocarbons, nitrogen oxides, and particulate matter. The EPA not only sets standards for the vehicles, engines, and equipment, but also the fuels that they use. Tables 12.12 through 12.25 contain summaries of the current standards.

Acronyms Used on Tables 12.12 through 12.25						
bhp	Brake horsepower-hour					
CI	Compression-ignition					
CO	Carbon Monoxide					
DE						
22	Diesel engine Gram					
g ~/IrNI						
g/kN	Grams per kilonewton					
g/mi	Grams per mile					
GVW	Gross vehicle weight					
HC	Hydrocarbons					
НСНО	Formaldehyde					
HLDT	Heavy light-duty truck					
Hp-hr	Horsepower-hour					
kW	Kilowatt					
kW-hr	Kilowatt-hour					
LDT	Light-duty truck					
LDV	Light-duty vehicle					
LEV	Low-emission vehicle					
LLDT	Light light-duty truck					
LVW	Loaded vehicle weight					
MDPV	Medium-duty passenger vehicle					
	(8,500-10,000 lbs. GVWR)					
NMHC	Non-methane hydrocarbon					
NMOG	Non-methane organic gases					
NOx	Nitrogen oxides					
PM	Particulate matter					
ppm	Parts per million					
rPR	Rated pressure ratio					
SI	Spark-ignition					
SULEV	Super-ultra-low-emission vehicle					
ULEV	Ultra-low-emission vehicle					
ZEV	Zero-emission vehicle					

These exhaust emission standards were phased-in from 2004 to 2010.

Note: Tests Covered: Federal Test Procedure (FTP), cold carbon monoxide, highway, and idle. Definitions of acronyms are on page 12-13.

^a In lieu of intermediate useful life standards (50,000 miles) or to gain ad ditional nitrogen oxides credit, manufacturers may optionally certify to the Tier 2 exhaust emission standards with a useful life of 150,000 miles.

^b Bins 9-11 expired in 2006 for light-duty vehicles and light light-duty trucks and 2008 for heavy light-duty trucks and medium-duty passenger vehicles.

^c Pollutants with two numbers have a separate certification standard (1st number) and in-use standard (2nd number).

 Table 12.14

 Heavy-Duty Highway Compression-Ignition Engines and Urban Buses – Exhaust Emission Standards

Sources:

40 CFR 86.099-11 Emission standards for 1999 and later model year diesel heavy-duty engines and vehicles. 40 CFR 86.004-11 Emission standards for 2004 and later model year diesel heavy-duty engines and vehicles.

40 CFR 86.007-11 Emission standards and supplemental requirements for 2007 and later model year diesel heavyduty engines and vehicles. (Additional resources: www.epa.gov/otaq/standards)

Note: The test procedures are the EPA Transient Test Procedure and the EPA Smoke Test Procedure. Definitions of acronyms are on page 12-13.

^h Load Response Test certification data submittal requirements take effect for heavy-duty diesel engines beginning in model year 2004. The following requirements take effect with the 2007 model year: steady-state test requirement and Not-to-Exceed (NTE) test procedures for testing of in-use engines. On-board diagnostic requirements applicable to heavy-duty diesel vehicles and engines up to 14,000 pounds gross vehicle weight rating (GVWR) phase in from the 2005 through 2007 model years.

^a Percentages apply to smoke opacity at acceleration/lug/peak modes.

^b Standards for 1990 apply only to diesel-fueled heavy-duty engines (HDE). Standards for 1991+ apply to both diesel- and methanol-fueled HDEs. Standards that apply to urban buses specifically are footnoted.

^c This standard applies to the following fueled engines for the following model years: methanol - 1990+, natural gas and liquefied petroleum gas (LPG) - 1994+.

^d For petroleum-fueled engines, the standard is for hydrocarbons (HC). For methanol-fueled engines, the standard is for total hydrocarbon equivalent (THCE).

^e Certification standard for urban buses for 1993.

^f Certification standard for urban buses from 1994-95.

^g Certification standard for urban buses from 1996 and later. The in-use standard is 0.07.

Table 12.14 (continued) Heavy-Duty Highway Compression-Ignition Engines and Urban Buses – Exhaust Emission Standards

¹ Subject to a Supplemental Emission Test (1.0 x Federal Test Procedure [FTP] standard (or Family Emission Limit [FEL]) for nitrogen oxides [NOx], NMHC, and particulate matter [PM]) and a NTE test (1.5 x FTP standard [or FEL] for NOx, NMHC, and PM).

^m EPA adopted the lab-testing and field-testing specifications in 40 CFR Part 1065 for heavy-duty highway engines, including both diesel and Otto-cycle engines. These procedures replace those previously published in 40 Code of Federal Regulations (CFR) Part 86, Subpart N. Any new testing for 2010 and later model years must be done using the 40 CFR Part 1065 procedures.

ⁿ Two-phase in-use NTE testing program for heavy-duty diesel vehicles. The program begins with the 2007 model year for gaseous pollutants and 2008 for PM. The requirements apply to diesel engines certified for use in heavy-duty vehicles (including buses) with GVWRs greater than 8,500 pounds. However, the requirements do not apply to any heavy-duty diesel vehicle that was certified using a chassis dynamometer, including medium-duty passenger vehicles with GVWRs of between 8,500 and 10,000 pounds.

^o NOx and NMHC standards will be phased in together between 2007 and 2010. The phase-in will be on a percent-of-sales basis: 50 percent from 2007 to 2009 and 100 percent in 2010.

^p Note that for an individual engine, if the useful life hours interval is reached before the engine reaches 10 years or 100,000 miles, the useful life shall become 10 years or 100,000 miles, whichever occurs first, as required under Clean Air Act section 202(d).

12 - 17

ⁱ The modified averaging, banking, and trading program for 1998 and later model year engines applies only to diesel cycle engines. Credits generated under the modified program may be used only in 2004 and later model years.

^j For heavy-duty diesel engines, there are three options to the measurement procedures currently in place for alternative fueled engines: (1) use a T HC measurement in place of an non-methane hydrocarbon (NMHC) measurement; (2) u se a measurement procedure specified by the manufacturer with prior approval of the Administrator; or (3) subtract two percent from the measured THC value to obtain an NMHC value. The methodology must be specified at time of certification and will remain the same for the engine family throughout the engines' useful life. For natural gas vehicles, EPA allows the option of measuring NMHC through direct quantification of individual species by gas chromatography.

^k Starting in 2006, refiners must begin producing highway diesel fuel that meets a maximum sulfur standard of 15 parts per million (ppm).

 Heavy-Duty Highway Spark-Ignition Engines – Exhaust Emission Standards

Sources:

40 CFR 86.1816-05, 86.1816-08 Emission standards for complete heavy-duty vehicles

40 CFR 86.1806-01, 86.1806-04, 86.1806-05 Onboard diagnostics requirements

40 CFR 86.1817-05, 86.1817-08 Complete heavy-duty vehicle averaging, banking, and trading program

40 CFR 86.091-10 Heavy-duty engine averaging, banking, and trading program for 1991 and later - Not available in the e-CFR

40 CFR Part 86 Subpart B Vehicle test procedures (Additional resources: www.epa.gov/otaq/standards)

Note: Definitions of acronyms are on page 12-13.

^c For methanol fueled engines the standard is for nitrogen oxides (NOx) plus NMHCE.

^g For natural gas fueled engines the standard is 0.9 g/bhp-hr non-methane hydrocarbon (NMHC).

^a For methanol-fueled engines, the standard is for total hydrocarbon equivalent (THCE).

^b For m ethanol and alcohol fueled vehicles the standard is for non-methane hydrocarbon equivalent (NMHCE).

^d Standards for heavy-duty engines are expressed in grams per brake horsepower-hour (g/bhp-hr). Starting with the 1998 model year, crankcase emissions are not allowed.

^e Standards for 1990 apply to gasoline and methanol-fueled engines.

^f Standards for 1991 and later apply to gasoline and methanol engines and are optional for natural gas and Liquefied Petroleum Gas-fueled engines through the 1996 model year.

Table 12.15 (continued) Heavy-Duty Highway Spark-Ignition Engines – Exhaust Emission Standards

^k Useful life is expressed in years or miles, whichever comes first. Useful life for the 1998 and later NOx standard and for all 2004 standards is 10 years or 110,000 miles, whichever comes first.

¹ Manufacturers can choose this standard or one of the following options: (1) a s tandard of 1.5 g/bhp-hr NMHC+NOX that applies to the 2004 through 2007 model years, with complete heavy-duty vehicle standards taking effect in 2005; or (2) a standard of 1.5 g/bhp-hr NMHC + NOX that would apply to the 2003 through 2007 heavy-duty engines and optionally to 2003 through 2006 complete heavy-duty vehicles.

^m Standard is expressed as non-methane organic gas, but compliance can optionally be shown using measurement of NMHC or total hydrocarbon (THC).

ⁿ Complete heavy-duty vehicles have the primary load-carrying container or device attached. Incomplete heavy-duty vehicles are certified to heavy-duty engine standards. Standards for complete heavy-duty vehicles are expressed in grams per mile (g/mi). Starting in 2005 (or 2003 or 2004 depending on the selected phase in option; see footnote l), complete heavy-duty vehicles under 14,000 lbs gross vehicle weight are tested on chassis-based rather than engine-based procedures and must meet these complete heavy-duty vehicle standards.

^o Although expressed as NMHC, compliance can optionally be shown using measurement of NMOG or THC.

^p At least 50 percent of a manufacturer's sales must meet these standards in 2008, with 100 percent required in 2009.

 q Gross vehicle weight ranges are more accurately specified as follows: 8,500 $\,$ GVW $\,$ 10,000 and 10,000 < GVW < 14,000.

^h For natural gas fueled engines the standard is 1.7 g/bhp-hr NMHC.

ⁱ The NOx standard is 5.0 for all natural gas-fueled engines.

^j This standard applies to the following engines utilizing aftertreatment technology (except for methanol) for the following model years: gasoline/1990+; natural gas and LPG/1991+; methanol/1990+. Starting in 2005, engines certified to on-board diagnostics requirements are not required to meet the idle carbon monoxide (CO) standard.

Table 12.16 Heavy-Duty Highway Compression-Ignition and Spark-Ignition Engines – Evaporative Emission Standards

Sources:

40 CFR 86.099-11 Emission standards for 1999 and later model year diesel heavy-duty engines and vehicles. 40 CFR 86.004-11 Emission standards for 2004 and later model year diesel heavy-duty engines and vehicles.

CFR 86.007-11 Emission standards and supplemental requirements for 2007 and later model year diesel heavy-duty engines and vehicles. (Additional resources: www.epa.gov/otag/standards)

Note: Definitions of acronyms are on page 12-13.

^a Applies to gasoline and methanol engines. Standard is hydrocarbon (HC) for gasoline engines, total hydrocarbon equivalent (THCE) for methanol engines.

^b For spark-ignition (SI) engines, standard applies to gasoline, methanol, natural gas, and liquefied petroleum gas engines. For compression-ignition (CI) engines, standard applies to methanol, natural gas, and liquefied petroleum gas engines. Standard is THCE for methanol engines, HC for others.

^c For SI engines, standard applies to gasoline and methanol engines. For CI engines, standard applies to methanol engines. Standard is THCE for methanol engines, HC for others.

^d Useful life is expressed in years or miles, whichever comes first.

^e Vehicles over 26,000 pounds gross vehicle weight may demonstrate compliance with an engineering design evaluation in lieu of testing.

^f A new enhanced evaporative test procedure applies, which is considerably more stringent than the previous test procedure despite the fact that the standard values do not change from prior years. Gasoline and methanol engines are phased in at the following rates of a manufacturer's sales for the specified model year: 1996: 20 percent; 1997: 40 percent; 1998: 90 percent; 1999: 100 percent.

^g A new enhanced evaporative test procedure applies, which is considerably more stringent than the previous test procedure despite the fact that the standard values do not change from prior years. Methanol-fueled vehicles are phased in at a rate of 90 percent of a manufacturer's production in 1998 and 100 percent in 1999.

- TSS=all aircraft gas turbine engines for aircraft operations at supersonic flight speeds
- TP=all aircraft turboprop engines

^d T3 engines are no longer manufactured but are in the existing fleet.

^b Federal standards apply to pl anes operating in the United States, regardless of where they were manufactured.

^c Rated output (rO) is the maximum power/thrust available for takeoff.

These standards apply to construction and agricultural equipment, such as excavators, paving equipment, tractors, combines, bulldozers, and skidders.

Table 12.19 (continued) Nonroad Compression-Ignition Engines – Exhaust Emission Standards

Source:

40 CFR 98.112 = Exhaust emission standards

40 CFR 1039.101 = Exhaust emission standards for after 2014 model year

40 CFR 1039.102 = Exhaust emission standards for model year 2014 and earlier

40 CFR 1039 Subpart F = Exhaust emissions transient and steady state test procedures

40 CFR Part 86 Subpart I = Smoke emission test procedures

40 CFR P art 1065 = Test equipment and emissions measurement procedures (Additional resources: www.epa.gov/otaq/standards)

Note: Definitions of acronyms are on page 12-13.

^a Smoke emissions may not exceed 20 percent during the acceleration mode, 15 percent during the lugging mode, and 50 percent during the peaks in either mode. Smoke emission standards do not apply to single-cylinder engines, constant-speed engines, or engines certified to a PM e mission standard of 0.07 grams per kilowatt-hour (g/kW-hr) or lower. Smoke emissions are measured using procedures in 40 CFR Part 86 Subpart I.

^b Useful life and warranty period are expressed hours and years, whichever comes first.

^c Hand-startable air-cooled direct injection engines may optionally meet a PM standard of 0.60 g/kW-hr. These engines may optionally meet Tier 2 standards through the 2009 model years. In 2010 these engines are required to meet a PM standard of 0.60 g/kW-hr.

^d Useful life for constant speed engines with rated speed 3,000 revolutions per minute (rpm) or higher is 5 years or 3,000 hours, whichever comes first.

^e These Tier 3 standards apply only to manufacturers selecting Tier 4 Option 2. M anufacturers selecting Tier 4 Option 1 will be meeting those standards in lieu of Tier 3 standards.

^f A manufacturer may certify all their engines to either Option 1 or Option 2 sets of standards starting in the indicated model year. Manufacturers selecting Option 2 must meet Tier 3 standards in the 2008-2011 model years.

^g These standards are phase-out standards. Not more than 50 percent of a manufacturer's engine production is allowed to meet these standards in each model year of the phase out period. Engines not meeting these standards must meet the final Tier 4 standards.

^h These standards are phased in during the indicated years. At least 50 percent of a manufacturer's engine production must meet these standards during each year of the phase in. Engines not meeting these standards must meet the applicable phase-out standards.

ⁱ For Tier 1 engines the standard is for total hydrocarbons.

^j The NOx standard for generator sets is 0.67 g/kW-hr.

^k The PM standard for generator sets is 0.03 g/kW-hr.

These standards apply to gasoline and propane industrial equipment such as forklifts, generators, airport service equipment, compressors and ice-grooming machines.

General Duty-Cycle Alternative Standards for Field Testing Standards Standards Severe-Duty Engines HC+NOx^a CO CO HC+NOx^a CO HC+NOx^a Useful Life Tier Year (g/kW-hr) (g/kW-hr) (g/kW-hr) (g/kW-hr) (g/kW-hr) (g/kW-hr) (years/hours) 1^{c} 2004-2006 4.0^{d} 50.0 4.0^d 130.0 7 / 5,000^e _ 2.7^{f} 4.4^{f} 2.7 3.8^f 130.0 6.5^f 7 / 5,000^e Evaporative Emission Standards (for engines fueled by a volatile liquid fuel) Fuel line Nonmetallic fuel lines must meet the permeation specifications of SAE Federal ^b permeation J2260 (November 1996) 2^{f} 2007 +Diurnal Evaporative HC emissions may not exceed 0.2 grams per gallon of fuel tank 5/emissions capacity Liquid fuel in the fuel tank may not reach boiling during continuous engine Running loss operation in the final installation at an ambient temperature of 30°C

 Table 12.20

 Nonroad Large Spark-Ignition Engines – Exhaust and Evaporative Emission Standards

Sources:

40 CFR 1048.101 = Exhaust emission standards 40 CFR 1048.105 = Evaporative emission standards 40 CFR 1048.110 = Engine diagnostic requirements (Additional resources: www.epa.gov/otaq/standards)

^f Optional engine certification is allowed according to the following formula: $(HC+NOx) \times CO^{0.784}$ 8.57. The HC+NOx and carbon monoxide (CO) emission levels selected to satisfy this formula, rounded to the nearest 0.1 g/kW-hr, become the emission standards that apply for those engines. One may not select an HC+NOx emission standard higher than 2.7 g/kW-hr or a CO emission standard higher than 20.6 g/kW-hr.

^a The numerical emission standards for hydrocarbons (HC) must be met based on the following types of hydrocarbon emissions for engines powered by the following fuels: (1) non-methane hydrocarbons (NMHC) for natural gas; (2) total hydrocarbon equivalent (THCE) for alcohol; and (3) total hydrocarbons (THC) for other fuels.

^b Voluntary Blue Sky standards for large spark-ignition (SI) engines are available. Engines with displacement at or below 1,000 cubic centimeters (cc) and maximum power at or below 30 kilowatts (kW) may be certified under the program for small SI engines.

^c Emission standards are based on testing over a steady-state duty-cycle.

^d The Tier 1 HC plus nitrogen oxides (NOx) emission standard for in-use testing is 5.4 grams per kW-hour (g/kW-hr).

^e Useful life is expressed in years and hours, whichever comes first. These are the minimum useful life requirements. For severe-duty engines, the minimum useful life is seven years or 1,500 hours of operation, whichever comes first. A longer useful life in hours is required if: (a) the engine is designed to operate longer than the minimum useful life based on the recommended rebuild interval; or (b) the basic mechanical warranty is longer than the minimum useful life.

 Table 12.21

 Locomotives – Exhaust Emission Standards

Sources:

40 CFR 1033.101 = Emission Standards and Useful Life

^b Line-haul locomotives are powered by an engine with a maximum rated power (or a combination of engines having a total rated power) greater than 2300 hp. Switch locomotives are powered by an engine with a maximum rated power (or a combination of engines having a total rated power) of 2300 hp or less.

^c The Tier 0 standards apply to loco motives manufactured after 1972 when they are manufactured or remanufactured. Note that interim standards may apply for Tier 0 or Tier 1 locomotives remanufactured in 2008 or 2009, or for Tier 2 locomotives manufactured or remanufactured in 2008-2012.

ⁱ The numerical emission standards for HC must be met based on the following types of hydrocarbon emissions for locomotives powered by the following fuels: (1) alcohol: total hydrocarbon equivalent (THCE) emissions for Tier 3 and earlier locomotives, and non-methane hydrocarbon equivalent (NMHCE) for Tier 4; (2) natural gas and liquefied petroleum gas: non-methane hydrocarbon (NMHC) emissions; and (3) di esel: total hydrocarbon (THC) emissions for Tier 3 and earlier locomotives, and NMHC for Tier 4.

^a These standards apply to locomotives that are propelled by engines with total rated horsepower (hp) of 750 kilowatts (kW) (1006 h p) or more, unless the owner chooses to have the equipment certified to meet the requirements of locomotives. This does not include vehicles propelled by engines with total rated horsepower of less than 750 kW (1006 hp); see the requirements in 40 Code of Federal Regulations (CFR) Parts 86, 89 and 1039. The test procedures specify chassis-based testing of locomotives. These test procedures include certification testing, production line testing, and in-use testing using the Federal Test Procedure (FTP) when the locomotive has reached between 50-70 percent of its useful life.

 $_{\rm d}$ Line-haul locomotives subject to the Tier 0 through Tier 2 emission standards must also meet switch standards of the same tier.

^e The Tier 0 standards apply for 1993-2001 locomotives not originally manufactured with a separate loop intake air cooling system.

^f Tier 3 line-haul locomotives must also meet Tier 2 switch standards.

^g Manufacturers using credits may elect to meet a combined nitrogen oxides (NOx) plus hydrocarbon (HC) standard of 1.4 grams per brakehorsepower-hour (g/bhp-hr) instead of the otherwise applicable Tier 4 NOx and HC standards.

^h Tier 1 and Tier 2 switch locomotives must also meet line-haul standards of the same tier.

Table 12.21 (continued)Locomotives – Exhaust Emission Standards

^o For locomotives originally manufactured before January 1, 2000, and not equipped with mw-hr meters.

^j Manufacturers may elect to meet a combined NOx+HC standard of 1.4 g/bhp-hr instead of the otherwise applicable Tier 4 NOx and HC standards.

^k The line-haul particulate matter (PM) standard for newly remanufactured Tier 2 locomotives is 0.20 g/bhphr until January 1, 2013, except as specified in 40 CFR Part 1033.150(a).

¹ The switch PM standard for new Tier 21ocomotives is 0.24 g/bhp-hr until January 1, 2013, ex cept as specified in 40 CFR Part 1033.150(a).

^m The smoke opacity standards apply only for locomotives certified to one or more PM standards or Family Emission Limits (FEL) greater than 0.05 g/bhp-hr. Percentages apply to smoke opacity at steady state/30-second peak/3-second peak, as measured continuously during testing.

ⁿ Useful life and warranty period are expressed in megawatt-hours (mw-hr), years, or miles, whichever comes first. Manufacturers are required to certify to longer useful lives if their locomotives are designed to last longer between overhauls than the minimum useful life value.

These standards apply to auxiliary and propulsion engines used by all types of recreational and commercial vessels, from small fishing boats to ocean-going ships.

 Marine Compression-Ignition (CI) Engines – Exhaust Emission Standards

Sources:

40 CFR 89.104 = Tiers 1 and 2 useful life & warranty period for marine CI engines less than 37 kW

40 CFR 89.112 = Tiers 1 and 2 emission standards for marine CI engines less than 37 kW

40 CFR 89 Subpart E = Tiers 1 and 2 test procedures for marine CI engines less than 37 kW

40 CFR 94.8 = Tiers 1 and 2 emission standards for C1 (both commercial & recreational), C2 and C3 engines

40 CFR 94.9 = Tiers 1 and 2 useful life for C1 (both commercial & recreational), C2 and C3 engines

40 CFR 94 Subpart B = Tiers 1 and 2 test procedures for C1 (both commercial & recreational), C2 and C3 engines

40 CFR 1042.101 = Tiers 3 and 4 exhaust emission standards and useful life

Table 12.22 (continued) Marine Compression-Ignition (CI) Engines – Exhaust Emission Standards

Sources (continued):

40 CFR 1042.107 = Tiers 3 and 4 ev aporative emission standards engines using a volatile liquid fuel (e.g., methanol)

40 CFR 1042.120 = Tiers 3 and 4 warranty period

40 CFR 1042 Subpart F = Tiers 3 and 4 test procedures (Additional resources: www.epa.gov/otaq/standards)

^a For Tiers 1 and 2, Category 1 marine engines are greater than or equal to 37 kilowatts (kW) and have a displacement less than 5.0 liters per cylinder (L/cylinder); Category 2 marine engines have a displacement greater than or equal to 5.0 L/cylinder and less than 30 L/cylinder; and Category 3 marine engines have a displacement greater than or equal to 30.0 L/cylinder. For Tiers 3 and 4, Category 1 represents engines up to 7 L/cylinder displacement; and Category 2 includes engines from 7 to 30 L/cylinder. The definition of Category 3 marine engines remains the same.

^b Tiers 1 and 2 for marine engines less than 37 kW are subject to the same emission standards as for landbased engines. See Table 1 in 40 Code of Federal Regulations (CFR) Part 89.112 and 40 CFR Part 89.104.

^c For Tiers 1 and 2, this refers to the rated power; for Tiers 3 and 4, this refers to the maximum engine power. ^d Total hydrocarbon (THC) plus nitrogen oxides (NOx) for Tier 2 standards.

^e Useful life is expressed in hours or years, whichever comes first. For Tiers 3 and 4, a longer useful life in hours for an engine family must be specified if either:1) the engine is designed, advertised, or marketed to operate longer than the minimum useful life; or 2) the basic mechanical warranty is longer than the minimum useful life.

^f Warranty period is expressed in years and hours, whichever comes first.

^g For Tiers 3 and 4, there are no evaporative emission standards for diesel-fueled engines, or engines using other nonvolatile or nonliquid fuels (e.g., natural gas). If an engine uses a volatile liquid fuel, such as methanol, the engine's fuel system and the vessel in which the engine is installed must meet the evaporative emission requirements of 40 Code of Federal Regulations (CFR) Part 1045 that apply with respect to spark-ignition engines. Manufacturers subject to evaporative emission standards must meet the requirements of 40 CFR 1045.112 as described in 40 CFR 1060.1(a)(2).

^h Indicates the model years for which the specified standards start.

ⁱ N is the maximum test speed of the engine in revolutions per minute (rpm).

^j Manufacturers of T ier 3 engines greater than or equal to 19 kW and less than 75 kW with displacement below 0.9 L/c ylinder may alternatively certify some or all of their engine families to a particulate matter (PM) emission standard of 0.20 grams per kilowatt-hour (g/kW-hr) and a NOx+HC emission standard fo 5.8 g/kW-hr for 2014 and later model years.

^k The applicable Tier 2 NOx+HC standards continue to apply instead of the Tier 3 values for engines at or above 2000 kW.

¹These Tier 3 standards apply to Category 1 engines below 3700 kW except for recreational marine engines at or above 3700 kW (with any displacement), which must meet the Tier 3 standards specified for recreational marine engines with a displacement of 3.5 to 7.0 L/cylinder.

^m The following provisions are optional: 1)Manufacturers may use NOx credits to certify Tier 4 engines to a NOX+HC emission standard of 1.9 g/kW-hr instead of the NOX and HC standards. See 40 CFR 1042.101(a)(8)(i) for more details. 2) For engines below 1000 kW, manufacturers may delay complying with the Tier 4 standards until October 1, 2017. 3) For engines at or above 3700 kW, manufacturers may delay complying with the Tier 4 standards until December 31, 2016.

ⁿ The Tier 4 standard is for HC (not HC+NOx) in g/kW-hr.

^o These Tier 3 standards apply to Category 2 engines below 3700 kW; no Tier 3 standards apply for Category 2 engines at or above 3700 kW, although there are Tier 4 standards that apply.

Table 12.22 (continued) Marine Compression-Ignition (CI) Engines – Exhaust Emission Standards

^p An alternative set of Tier 3 and Tier 4 standards for PM, NOx, and HC are available for Category 2 engines at or above 1400 kW, but must be applied to all of a manufacturer's engines in a given displacement category in model years 2012 through 2015.

	Maximum				
	Engine	Model	PM	NOx	HC
Tier	Power	Year	(g/kW-hr)	(g/kW-hr)	(g/kW-hr)
3	kW 1400	2012-2014	0.14	7.8 N	Ox+HC
4	1400 kW < 3700	2015	0.04	1.8	0.19
4	kW 3700	2015	0.06	1.8	0.19

^q Interim Tier 4 PM s tandards apply for 2014 and 2015 model year Category 2 engines with per-cylinder displacement at or above 15.0 liters: 0.34 g/kW-hr for engines 2000 = kW < 3000, and 0.27 g/kW-hr for engines 3300 = kW < 3700.

					+ NOx ^a KW-hr)	CC (g/KV	-

12-32

and sterndrive/inboard engines.

40 CFR 91.104 = Outboard and personal watercraft (PWC) exhaust emission standards (1998-2009)

40 CFR 91.105 = Outboard and PWC useful life (1998-2009)

40 CFR 1045.103 = Outboard and PWC exhaust emission standards (2010+)

40 CFR 1045.105 = Sterndrive/Inboard exhaust emission standards

40 CFR 1045.107 = Not-to-exceed exhaust emission standards (Additional resources: www.epa.gov/otaq/standards)

^a The numerical emission standards for hydrocarbons (HC) must be met based on the following types of HC emissions for engines powered by the following fuels: (1) total hydrocarbon equivalent for alcohol; (2) non-methane hydrocarbon for natural gas; and (3) total hydrocarbons for other fuels.

Table 12.23 (continued) Marine Spark-Ignition Engines and Vessels – Exhaust Emission Standards

^b P stands for the maximum engine power in kilowatts.

^c Manufacturers may generate or use emission credits for averaging, but not for banking or trading.

^d Useful life and warranty period are expressed hours or years of operation (unless otherwise indicated), whichever comes first.

^e The test procedure for federal standards uses the International Organization for Standardization (ISO) 8178 E4 5-Mode Steady-State Test Cycle.

^f Also applies to model year (MY) 1997 engine families certified pursuant to 40 Code of Federal Regulations (CFR) 91.205.

^g Not-to-exceed emission standards specified in 40 CFR 1045.107 also apply.

^h A longer useful life in terms of hours must be specified for the engine family if the average service life is longer than the minimum value as described in 40 CFR 1045.103(e)(3).

ⁱ The useful life may not be shorter than: (1) 150 hours of operation; (2) the recommended overhaul interval; or (3) the engine's mechanical warranty. A longer useful life must be specified in terms of hours if the average service life is longer than the minimum value as described in 40 CFR 1045.105(e)(3).

These standards apply to land-based recreational vehicles, such as snowmobiles, dirt bikes, all-terrain vehicles and go-karts.

				HC ^a	HC + NOx	C	0	Minimum Useful Life

 Table 12.24

 Nonroad Recreational Engines and Vehicles – Exhaust Emission Standards

Sources:

40 CFR 1051.101-115 = Emission standards (Additional resources: www.epa.gov/otaq/standards)

^a The numerical emission standards for hydrocarbons (HC) must be met based on the following types of hydrocarbon emissions for recreational engines and vehicles powered by the following fuels: (1) n on-methane hydrocarbons for natural gas; (2) total hydrocarbon equivalent for alcohol; and (3) total hydrocarbons for other fuels.

^b Useful life is expressed in hours, years, or kilometers, whichever comes first; warranty period is expressed in hours, months, or kilometers (km), whichever comes first. Nonroad recreational engines and vehicles must meet emission standards over their full useful life. A longer useful life in terms of km and hours must be specified for the engine family if the average service life is longer than the minimum value as described in 40 C ode of F ederal Regulations (CFR) 1051 Subpart B.

^c Test procedures for snowmobiles use the equipment and procedures for spark-ignition engines in 40 CFR Part 1065.

^d Phase 1 standards will be phased in: 50 percent by 2006, 100 percent by 2007.

^e Litigation on the November 2002 final rule resulted in a co urt decision that r equires EPA to clarify the evidence and analysis upon which the Phase 3 carbon monoxide (CO) and HC standards were based. EPA will address this in a future rulemaking.

^f These are the maximum allowable family emission limits (FEL). The HC and CO standards are defined by a functional relationship as described in 40 CFR 1051.103(a)(2).

^g For off-highway motorcycles and ATVs, chassis dynamometer emissions test procedures are specified in 40 CFR Part 86, Subpart F and engine dynamometer emissions test procedures are specified in 40 CFR Part 1065.

^h Maximum allowable FEL: 20.0 grams per kilometer (g/km) for HC plus nitrogen oxides (NOx) and 50 g/km for CO.

Table 12.24 (continued) Nonroad Recreational Engines and Vehicles – Exhaust Emission Standards

^k Manufacturers may certify all-terrain vehicles with engines that have total displacement of less than 100 cc to an HC+NOx standard of 25.0 g/KW-hr (with an FEL cap of 40.0 g/kW-hr) and a CO standard of 500 g/kW-hr.

ⁱ Manufacturers may certify off-highway motorcycles with engines that have total displacement of 70 cubic centimeters (cc) or l ess to an HC+NOx standard of 16.1 grams per kilowatt-hour (g/kW-hr) (with an FEL cap of 32.2 g/kW-hr) and a CO standard of 519 g/kW-hr. ^j Maximum allowable FEL for HC+NOx is 20.0 g/km.

These standards were established in conjunction with the Tier 2 light vehicle standards to maintain the performance of catalytic converters.

Table 12.25Gasoline Sulfur Standards

Source:

40 CFR Part 80 Subpart H (Additional resources: www.epa.gov/otaq/standards)

^a Standards effective January 1 at the refinery gate.

^b No Refinery Average Standard applies in 2004; Corporate Average Standard applies in 2004 (120 ppm) and 2005 (90 ppm).

^c Cap exceedances up to 50 ppm in 2004 must be made up in 2005.

^d Geographic Phase-in Area (GPA) refiners must also comply with the corporate average standards in 2004 and 2005 if less than 50% of the refiner's gasoline is designated as GPA gasoline in a given compliance period.

^e GPA refiners may receive an additional two years (i.e., through 2008) to com ply with the 30 / 80 ppm gasoline sulfur standards in exchange for producing 95% of their highway diesel fuel at the 15 ppm sulfur standard by June 1, 2006.

^f Small refiners may receive an additional two years (i.e., through 2009) to com ply with the 30 / 80 ppm gasoline sulfur standards via a hardship demonstration.

^g Small refiners may receive an additional three years (i.e., through 2010) to com ply with the 30 / 80 ppm gasoline sulfur standards in exchange for producing 95% of their highway diesel fuel at the 15 ppm sulfur standard by June 1, 2006.

^h Small refiners may receive a 20% increase in their annual average and per-gallon cap standards in exchange for producing 95% of their highway, nonroad, locomotive, and marine diesel fuel at the 15 ppm sulfur standard by June 1, 2006.

ⁱ Downstream standards are effective February 1 at an y downstream location other than at a r etail outlet or wholesale purchaser-consumer (e.g., pipelines and terminals) and March 1 at any downstream location.

^j Downstream standards for gasoline that is not blended with small refiner gasoline are shown. Refer to the Code of Federal Regulations (CFR) for the downstream standards that apply when a gasoline blend includes small refiner gasoline.

1997-98 Refinery	Small Refiner Interi	m Gasoline Sulfur
Baseline Sulfur Level	Standards (ppm) 2004 - 2007
(ppm)	Average	Сар
0 to 30	30	300
31 to 200	baseline level	300
201 to 400	200	300
401 to 600	50% of baseline	1.5 x avg. standard
601 and above	300	450

Ultra-low sulfur diesel (ULSD) fuel is necessary for new advanced emission control technologies. It also reduces particulate matter in the existing fleet of nonroad engines and equipment.

APPENDIX A

SOURCES & METHODOLOGIES

SOURCES & METHODOLOGIES

This appendix contains documentation of the estimation procedures used by ORNL. The reader can examine the methodology behind the estimates and form an opinion as to their utility. The appendix is arranged by subject he ading. Only tables which contain ORNL estimations are doc umented in Appendix A; all other tables have sources listed at the bottom of the table. Since abbreviations are used throughout the appendix, a list of abbreviations is also included.

Highway energy use

Automobiles

Fuel use in gallons (1970-2008) from: DOT, FHWA, *Highway Statistics 2008*, Table VM-1 and annual editions back to 1996; DOT, FHWA, *Highway Statistics Summary* to 1995. Data for 2009 were estimated; FHWA discontinued automobile fuel use data in 2009. Fuel use was distributed among fuel types using the percentages shown in Table A.1. The FHWA discontinued gasohol data in 2005. Therefore, data from EIA, *Alternatives to Traditional Transportation Fuels*, 2006, Table C1 were used.

Table A.1
Automobile Fuel Use and Fuel Type Shares for Calculation of Energy Use

Off-highway energy use

U.S. Environmental Protection Agency, NONROAD2008a model, results generated April 2011. Gallons of fuel by fuel type were produced for agricultural equipment, airport equipment, construction and mining equipment, industrial equipment, lawn and garden equipment, logging equipment, railroad maintenance equipment, and recreational equipment. Some non-transportation-related equipment, such as generators, chain saws, compressors, and pumps, were excluded from the data.

Nonhighway energy use

Table A.10
Recreational Boating Fuel Use

Pipeline

The sum of natural gas, crude petroleum and petroleum product, and coal slurry and water.

Natural Gas:

The amount of natural gas used to transport natural gas was defined as "pipeline fuel" as reported in DOE, EIA, *Natural Gas Annual 2009*, Table 1. Cubic feet were converted to Btu using 1,031 Btu/ft3. Electricity use was estimated using the following procedure as reported on p. 5- 110 of J. N. Hook er et al., End Use Energy Consumption DataBase: Transportation Sector. The energy consumption of a natural gas pipeline was taken to be the energy content of the fuel used to drive the pumps. S ome 94% of the installed pumping horsepower was supplied by natural gas. The remaining 6% of the horsepower was generated more efficiently, mostly by electric motors. The energy consumed by natural gas pipeline pumps that were electrically powered was not known. In order to estimate the electricity consumed, the Btu of na tural gas pipeline fuel consumed was multiplied by a factor of 0.015. F rom this computed value, electricity efficiency and generation loss must be taken into account. The electricity energy use in Bt u must be converted to k Whr, using the conversion factor 29.305 x 10-5 kWhr/Btu. Electricity generation and d istribution efficiency was 29%. When generation and d istribution efficiency are taken into account, 1 kWhr equals 10,339 Btu.

Crude petroleum and petroleum product:

J. N. Hook er, *Oil Pipeline Energy Consumption and Efficiency*, ORNL-5697, ORNL, Oak Ridge, TN, 1981. (Data held constant; Latest available data.)

Coal slurry and water:

W. F. Banks, Systems, Science and Software, *Energy Consumption in the Pipeline Industry*, LaJolla, CA, October 1977. (Data held constant; Latest available data.)

conversion to Btu	Btu/gallon	Btu/kWhr

Table A.15Intercity Rail Fuel Use

Calculation of Million Barrels per Day <u>Crude Oil Equivalent</u>

One gallon of gasoline, diesel fuel, or lpg is estimated to be the equivalent of one gallon of crude oil. Petroleum used for electricity was calculated using the following formula:

({[(BTU*S)/G]/P}/365)/1000

- BTU = Btus of electricity from Table 2.5
- S = Share of petroleum used in making primary electricity (Calculated from Table 2.6 from the EIA, Monthly Energy Review)
- G = Electricity generation and distribution (assumed 29%)
- P = Btus per barrel of petroleum product (Table A3 from the EIA, Monthly Energy Review).

Passenger Travel and Energy Use

Automobiles

Number of vehicles, vehicle-miles – DOT, FHWA, *Highway Statistics*, 2009, Table VM-1. Data series shown in Table 4.1.

Passenger-miles – Vehicle-miles multiplied by an average load factor.

Load factor – 2009 NHTS shows automobile load factor as 1.55 persons per vehicle (preliminary). **Energy intensities** –

Btu per vehicle-mile – Automobile energy use divided by vehicle-miles.

Btu per passenger-mile – Automobile energy use divided by passenger-miles.

Energy use – See Energy Use Sources, p. A-5. Data series shown in Table 2.7.

Light Trucks

Number of vehicles, vehicle-miles – DOT, FHWA, *Highway Statistics 2009*, Table VM-1. Data by truck type were multiplied by the shares of trucks/truck travel which are for personal use (Table A.16).

Passenger-miles – Vehicle-miles multiplied by an average load factor.

Load factor – 2009 NH TS shows personal light truck load factor as 1. 84 persons per vehicle (preliminary).

Energy intensities -

Btu per vehicle-mile – Personal light truck energy use divided by personal light truck vehicle-miles. *Btu per passenger-mile* – Personal light truck energy use divided by personal light truck passenger-miles.

Energy use – See Energy Use Sources, p. A-9, A-10 (light trucks, medium/heavy trucks). Data by truck type were multiplied by the shares of truck fuel use which are for personal use (Table A.16) which were derived by ORNL from the 2002 VIUS Micro Data File on CD.

Table A.16

Share of Trucks, Truck Travel, and Fuel Use for Personal Travel		
Personal trucks		
85.6%	2-axle, 4-tire trucks	
26.9%	Other single-unit and combination trucks	
Personal truck trave	el	
80.9%	2-axle, 4-tire trucks	
13.1%	Other single-unit and combination trucks	
Personal truck fuel	use	
78.0%	2-axle, 4-tire trucks	
6.0% Other single-unit and combination trucks		

Note: Since these shares come from the 2002 VIUS, they may underestimate the amount of personal trucks, truck travel, and energy use for 2008.

Motorcycles

Number of vehicles, vehicle-miles – DOT, FHWA, *Highway Statistics 2009*, Table VM-1. **Passenger-miles** – Vehicle-miles multiplied by an average load factor.

Load factor - 2009 NHTS shows motorcycle load factor as 1.16 persons per vehicle (preliminary). **Energy intensities** –

Btu per vehicle-mile – Motorcycle energy use divided by vehicle-miles.

Btu per passenger-mile – Motorcycle energy use divided by passenger-miles.

Energy use – See Energy Use Sources, p. A-6. Data series shown in Table 2.7.

Demand Response

Number of vehicles, vehicle-miles, passenger-miles – APTA, 2011 Public Transportation Fact Book, Washington, DC, 2011.

Load factor - Passenger-miles divided by vehicle-miles.

Energy intensities –

Btu per vehicle-mile – Energy use divided by vehicle-miles.

Btu per passenger-mile – Energy use divided by passenger-miles. Energy use – APTA, 2011 Public Transportation Fact Book, Washington, DC, 2011.

Buses

Transit

Number of vehicles, vehicle-miles, passenger-miles – APTA, 2011 Public Transportation Fact Book, Washington, DC, 2011. Data series shown on Table 5.16.

Load factor – Passenger-miles divided by vehicle-miles.

Energy intensities –

Btu per vehicle-mile – Transit bus energy use divided by transit bus vehicle-miles.

Btu per passenger-mile – Transit bus energy use divided by transit bus passenger-miles.

Energy use – See Energy Use Sources, p. A-7. Data series shown in Table 5.16.

Intercity

Energy use – See Energy Use Sources, p. A-7. Because the 2001and 2002 data are not available, the rate of change in bus VMT from FHWA, *Highway Statistics 2009*, was used to estimate the change in energy use.

School

Number of vehicles – DOT, FHWA, Highway Statistics 2009, Table MV-10.

Energy use – See Energy Use Sources, p. A-7. Because the data past 2000 are not available, the rate of change in bus VMT from FHWA, *Highway Statistics 2009*, was used to estimate the change in energy use.

Air

Certificated air carriers

Aircraft-miles, passenger-miles – DOT, BTS, Air Carrier Traffic Statistics, www.bts.gov/programs/airline_information/air_carrier_traffic_statistics, Washington, DC. Load factor – Passenger-miles divided by aircraft-miles.

Energy intensities –

Btu per passenger-mile – Certificated air carrier energy use divided by passenger-miles.

Energy use – See Energy Use Sources, p. A-11. All of domestic fuel use and half of international fuel use was considered to be domestic use.

Note: These data differ from the data in Table 9.2 because that table contains data on ALL domestic AND international air carrier energy use and passenger-miles.

General aviation

Number of vehicles – DOT, FAA, *General Aviation Activity and Avionics Survey: Calendar Year* 2009, Data series shown in Table 9.3.

Energy intensities -

Btu per passenger-mile – General aviation energy use divided by passenger-miles. **Energy use** – See Energy Use Sources, p. A-11. Data series shown in Table 9.3.

Recreational boating

Number of vehicles and energy use – U.S. EPA, NONROAD2008a model.

Rail

Intercity

 Number of vehicles, vehicle-miles, passenger-miles – AAR, Railroad Facts, 2010 Edition, Washington, DC, 2010.
 Load factor – Passenger-miles divided by vehicle-miles.
 Energy Intensities – Btu per vehicle-mile – Intercity rail energy use divided by vehicle-miles.

Btu per passenger-mile – Intercity rail energy use divided by passenger-miles.

Energy use – See Energy Use Sources, p. A-20. Data series shown in Table 9.10.

Transit

Number of vehicles, vehicle-miles, passenger-miles – APTA, 2011 Public Transportation Fact Book, Washington, DC, 2011. Sum of light and heavy rail transit. Data series shown on Table 9.12.

Load factor – Passenger-miles divided by vehicle-miles.

Energy intensities –

Btu per vehicle-mile – Light and heavy transit rail energy use divided by vehicle-miles.

Btu per passenger-mile – Light and heavy transit rail energy use divided by passenger-miles. **Energy use** – See Energy Use Sources, p. A-19. Data series shown in Table 9.12.

Commuter

Number of vehicles, vehicle-miles, passenger-miles – APTA, 2011 Public Transportation Fact Book, Washington, DC, 2011. Data series shown on Table 9.11.

Load factor – Passenger-miles divided by vehicle-miles.

Energy intensities -

Btu per vehicle-mile – Commuter rail energy use divided by vehicle-miles.

Btu per passenger-mile – Commuter rail energy use divided by passenger-miles. **Energy use** – See Energy Use Sources, p. A-18. Data series shown in Table 9.11.

Highway Passenger Mode Energy Intensities

Automobiles

Btu per vehicle-mile – Automobile energy use divided by automobile vehicle miles of travel. Energy use - See Energy Use Sources, p. A-5. Data series shown in Table 2.7.

Vehicle-miles - DOT, FHWA, Highway Statistics 2009, Table VM-1 and annual editions back to 1996; DOT, FHWA, Highway Statistics Summary to 1995. Data series shown in Table 4.1.

Btu per passenger-mile – Automobile energy use divided by automobile passenger-miles.

Energy use - See Energy Use Sources, p. A-5. Data series shown in Table 2.7.

Passenger miles - Vehicle miles multiplied by an average load factor.

Vehicle-miles - DOT, FHWA, Highway Statistics 2009, Table VM-1 and annual editions back to 1996; DOT, FHWA, Highway Statistics Summary to 1995. Data series shown in Table 4.1. Load factor - NPTS 1969, 1977, 1983/84, 1990, and 1995; NHTS 2001 and 2009.

Table A.17 Automobile Load Factor used to calculate Passenger-Miles

2009	2009 NHTS	1.55					

Light trucks

- Btu per vehicle-mile Light truck energy use divided by light truck vehicle miles of travel.
 - Energy use See Energy Use Sources, p. A-9. Data series shown in Table 2.7.
 - Vehicle-miles DOT, FHWA, Highway Statistics 2009, Table VM-1 and annual editions back to 1996; DOT, FHWA, Highway Statistics Summary to 1995. Data series shown in Table 4.2.

Buses

Transit

- Btu per vehicle-mile Transit bus energy use divided by transit bus vehicle-miles.
 Energy use See Energy Use Sources, p. A-7. Data series shown in Table 5.16.
 Vehicle-miles APTA, 2011 Public Transportation Fact Book, Washington, DC, 2011. Data series shown on Table 5.16.
- Btu per passenger-mile Transit bus energy use divided by transit bus passenger-miles.
 Energy use See Energy Use Sources, p. A-7. Data series shown in Table 5.16.
 Passenger-miles APTA, 2011 Public Transportation Fact Book, Washington, DC, 2011. Data series shown on Table 5.16.

Intercity

- Btu per passenger-mile Intercity bus energy use divided by intercity bus passenger-miles.
 - *Energy use* See Energy Use Sources, p. A-8. Because the data past 2000 are not available, the rate of change in bus VMT from FHWA, *Highway Statistics 2009*, was used to estimate the change in energy use.
 - **Passenger-miles** (Data past 2000 a re not av ailable.) Eno Foundat ion for Transportation, *Transportation in America 2001*, Nineteenth edition, Washington, DC.

Nonhighway Mode Energy Intensities

Air

Certificated air carriers

- Btu per passenger-mile Certificated air carrier energy use divided by passenger-miles.
 - *Energy use* See Energy Use Sources, p. A-12. All of domestic fuel use and half of international fuel use was considered to be domestic use.
 - **Passenger-miles** DOT, BTS, Air Carrier Traffic Statistics, Washington, DC, ww.bts.gov/programs/airline_information/air_carrier_traffic_statistics. Pre-1994 data a re from various editions of the FAA Statistical Handbook of Aviation (no longer published). Scheduled service passenger-miles of domestic air carriers and half of international air carriers were used to coincide with fuel use.

Note: These data differ from the data in Table 9.2 because that table contains data on ALL domestic AND international air carrier energy use and passenger-miles.

General aviation

Btu per passenger-mile – General aviation energy use divided by passenger-miles.
 Energy use – See Energy Use Sources, p. A-11. Data series shown in Table 9.3.
 Passenger-miles – (Data past 2000 not available.) Eno Foundation for Transportation, Transportation in America 2001, Nineteenth edition, Washington, DC.

Rail

Intercity

Btu per passenger-mile – Intercity rail energy use divided by passenger-miles.
 Energy use – See Energy Use Sources, p. A-20. Data series shown in Table 9.10.
 Passenger-miles – AAR, Railroad Facts, 2010 Edition, and previous annual editions.

Transit

Btu per passenger-mile – Transit rail energy use divided by passenger-miles.
Energy use – See Energy Use Sources, p. A-19. Data series shown in Table 9.12.
Passenger-miles – APTA, 2011 Public Transportation Fact Book, Washington, DC, 2011. Data series shown on Table 9.12.

Commuter

Btu per passenger-mile – Commuter rail energy use divided by passenger-miles.
Energy use – See Energy Use Sources, p. A-18. Data series shown in Table 9.11.
Passenger-miles – APTA, 2011 Public Transportation Fact Book, Washington, DC, 2011. Data series shown on Table 9.11.

Freight Movement and Energy Use

Rail

Number of locomotives, ton-miles, tons shipped, average length of haul – AAR, *Railroad Facts*, 2010 *Edition*, Washington, DC, 2010. Data series shown in Table 9.8.
Energy intensity – Class I rail energy use divided by freight car-miles.
Energy use – See Energy Use Sources, p. A-16. Data series shown in Table 9.8.

Water

Number of vehicles – U.S. Department of the Army, Army Corps of Engineers, Waterborne Transportation Lines of the United States, Calendar Year 2009, Volume 1—National Summaries, New Orleans, LA, 2010.

Ton-miles, tons shipped, average length of haul – U.S. Department of the Army, Army Corps of Engineers, *Waterborne Commerce of the United States, Calendar Year 2009, Part 5: National Summaries*, New Orleans, LA, 2010. Data series shown in Table 9.5.

Btu per ton-mile – Domestic waterborne commerce energy use divided by ton-miles.

Energy use – See Energy Use Sources, p. A-13. Data series shown in Table 9.5.

Freight Mode Energy Intensities

Truck

Btu per vehicle-mile – Heavy single-unit and combination truck energy use divided by vehicle miles *Energy use* – See Energy Use Sources (medium/heavy trucks), p. A-10.

Vehicle-miles – DOT, FHWA, *Highway Statistics 2009*, Table VM-1 and annual ed itions back to 1996; DOT, FHWA, *Highway Statistics Summary to 1995*. Data series is the total of vehicle travel data on Tables 5.1 and 5.2.

Rail

Btu per freight car-mile – Class I rail energy use divided by freight car-miles.
Energy use – See Energy Use Sources, p. A-17. Data series shown in Table 9.8.
Freight car miles – AAR, Railroad Facts, 2010 Edition, Washington, DC, 2010. Data series shown in Table 9.8.

Btu per ton-mile – Class I rail energy use divided by ton-miles.

Energy use – See Energy Use Sources, p. A-17. Data series shown in Table 9.8.
 Ton-miles – AAR, Railroad Facts, 2010 Edition, Washington, DC, 2010. Data ser ies shown in Table 9.8.

Water

Btu per ton-mile – Domestic waterborne commerce energy use divided by ton-miles.

Energy use – See Energy Use Sources, p. A-13. Data series shown in Table 9.5.

Ton-miles – U.S. Department of the Army, Army Corps of Engineers, *Waterborne Commerce of the United States, Calendar Year 2009*, Part 5: National Summaries, New Orleans, LA, 2010. Data series shown in Table 9.5.

APPENDIX B

CONVERSIONS

CONVERSIONS

A Note about Heating Values

The heat content of a fuel is the quantity of energy released by burning a unit amount of that fuel. However, this value is not absolute and can vary according to several factors. For example, empirical formulae for determining the heating value of liquid fuels depend on the fuels' American Petroleum Institute (API) gravity. The A PI gravity varies depending on the percent by weight of the chemical constituents and impurities in the fuel, both of which are affected by the combination of raw materials used to produce the fuel and by the type of manufacturing process. Temperature and climatic conditions are also factors.

Because of these variations, the heating values in Table B.4 may differ from values in other publications. The figures in this report are representative or average values, not absolute ones. The gross (higher) heating values used here agree with those used by the Energy Information Administration (EIA).

Heating values fall into two categories, usually referred to as "higher" (or gross) and "lower" (or net). If the products of fuel combustion are cooled back to the initial fuel-air or fuel-oxidizer mixture temperature and the water formed during combustion is condensed, the energy released by the process is the higher (gross) heating value. I f the products of combustion are cooled to the initial fuel-air temperature, but the water is considered to remain as a vapor, the energy released by the process is the lower (net) heating value. Usually the difference between the gross and net heating values for fuels used in transportation is around 5 to 8 percent; however, it is important to be consistent in their use.

1 kilogram hydrogen =					
Higher heating value	Lower heating value				
134,200 Btu	113,400 Btu				
39.3 kWhr	33.2 kWhr				
141,600 kJ	119,600 kJ				
33,800 kCal	28,560 kCal

One million millionth	10 ⁻¹²	pico	р
One thousand millionth	10-9	nano	n
One millionth	10-6	micro	μ
One thousandth	10-3	milli	m
One hundredth	10-2	centi	С
One tenth	10-1	deci	
One	10^{0}		
Ten	10^{1}	deca	
One hundred	10^{2}	hecto	
One thousand	10^{3}	kilo	k
One million	10^{6}	mega	М
One billion ^a	10^{9}	giga	G
One trillion ^a	10^{12}	tera	Т
One quadrillion ^a	10^{15}	peta	Р
One quintillion ^a	10^{18}	exa	E

Table B.14SI Prefixes and Their Values

^aCare should be exercised in the use of this nomenclature, especially in foreign correspondence, as it is either unknown or carries a different value in other countries. A "billion," for example, signifies a value of 10^{12} in most other countries.

Quantity	Unit name	Symbol
Energy	joule	J
Specific energy	joule/kilogram	J/kg
Specific energy consumption	joule/kilogram•kilometer	$J/(kg \cdot km)$
Energy consumption	joule/kilometer	J/km
Energy economy	kilometer/kilojoule	km/kJ
Power	kilowatt	kW
Specific power	watt/kilogram	W/kg
Power density	watt/meter ³	W/m^3
Speed	kilometer/hour	km/h
Acceleration	meter/second ²	m/s^2
Range (distance)	kilometer	km
Weight	kilogram	kg
Torque	newton•meter	N•m
Volume	meter ³	m ³
Mass; payload	kilogram	kg
Length; width	meter	m
Brake specific fuel consumption	kilogram/joule	kg/J
Fuel economy (heat engine)	liters/100 km	L/100 km

Table B.15Metric Units and Abbreviations

Fuel Type	
Coal	
Coal (residential)	26.04
Coal (commercial)	26.04
Coal (industrial coking)	25.63
Coal (industrial other)	25.74
Coal (electric utility)	25.98
Natural gas	
Natural gas (pipeline)	14.47
Natural gas (flared)	14.92
Petroleum	
Asphalt and road oil	20.62
Aviation gasoline	18.87
Crude oil	20.30
Distillate fuel	19.95
Jet fuel	19.33
Kerosene	19.72
LPG	16.99
Lubricants	20.24
Motor gasoline	19.34
Petrochemical feed.	19.37
Petroleum coke	27.85
Residual fuel	21.49
Waxes	19.81

Table B.16Carbon Coefficients, 2002(Million metric tons carbon per quadrillion Btu)

Note: All coefficients based on Higher Heating (Gross Calorific) Value and assume 100 percent combustion.

Conversion of Constant Dollar Values

Many types of information in this data book are expressed in dollars. Generally, constant dollars are used-that is, dollars of a fixed value for a specific year, such as 1990 dollars. Converting current dollars to constant dollars, or converting constant dollars for one year to constant dollars for another year, requires conversion factors (Table B.17 and B.18). T able B.17 shows c onversion factors for the Consumer Price Index inflation factors. Table B.18 shows conversion factors using the Gross National Product inflation factors.

Note: Reformulated gasoline is a motor gasoline specially formulated to achieve significant reductions in vehicle emissions of ozone-forming and toxic air pollutants. The Clean Air Act of 1990 mandates reformulated gasoline use in areas with ozone-air pollution problems.

GLOSSARY

Acceleration power – Measured in kilowatts. Pulse power obtainable from a battery used to accelerate a vehicle. This is based on a constant current pulse for 30 seconds at no less than 2/3 of the maximum open-circuit-voltage, at 80% depth-of-discharge relative to the battery's rated capacity and at 20° C ambient temperature.

Air Carrier – The commercial system of air transportation consisting of certificated air carriers, air taxis (including commuters), supplemental air carriers, commercial operators of large aircraft, and air travel clubs.

Certificated route air carrier: An air carrier holding a Certificate of Public Convenience and Necessity issued by the Department of Transportation to conduct scheduled interstate services. Nonscheduled or charter operations may also be con ducted by these carriers. These carriers operate large aircraft (30 seats or more, or a maximum payload capacity of 7,500 pounds or more) in accordance with Federal Aviation Regulation part 121.

Domestic air operator: Commercial air transportation within and between the 50 States and the District of Columbia. Includes operations of certificated route air carriers, Pan American, local service, helicopter, intra-Alaska, intra-Hawaii, all-cargo carriers and other carriers. Also included are transborder operations conducted on the domestic route segments of U.S. air c arriers. Domestic operators are classified based on their operating revenue as follows:

Majors - over \$1 billion Nationals - \$100-1,000 million Large Regionals - \$10-99.9 million Medium Regionals - \$0-9.99 million

International air operator: Commercial air transportation outside the territory of the U nited States, including operations between the U.S. and foreign countries and between the U.S. and its territories and possessions.

Supplemental air carrier: A class of air carriers which hold certificates authorizing them to perform passenger and cargo charter services supplementing the scheduled service of the certificated route air carriers. Supplemental air carriers are often referred to as nonscheduled air carriers or "nonskeds."

- Alcohol The family name of a group of organic chemical compounds composed of carbon, hydrogen, and oxygen. The molecules in the series vary in chain length and are composed of a hydrocarbon plus a hydroxyl group. Alcohol includes methanol and ethanol.
- Alternative fuel For transportation applications, includes the following: methanol; denatured ethanol, and other alcohols; fuel mixtures containing 85 percent or more by volume of methanol, denatured ethanol, and other alcohols with gasoline or other fuels; natural gas; liquefied petroleum gas (propane); hydrogen; coal-derived liquid fuels; fuels (other than alcohol) derived from biological materials (biofuels such as soy diesel fuel); and electricity (including electricity from solar energy). The term "alternative fuel" does not include alcohol or other blended portions of primarily petroleum-based fuels used as oxygenates or extenders, i.e. MTBE, ETBE, other ethers, and the 10-percent ethanol portion of gasohol.

Amtrak – See Rail.

- Anthropogenic Human made. Usually used in the context of emissions that are produced as the result of human activities.
- **Automobile size classifications** S ize classifications of automobiles are established by the Environmental Protection Agency (EPA) as follows:

Minicompact – less than 85 cubic feet of passenger and luggage volume. Subcompact – between 85 to 100 cubic feet of passenger and luggage volume. Compact – between 100 to 110 cubic feet of passenger and luggage volume. Midsize – between 110 to 120 cubic feet of passenger and luggage volume. Large – more than 120 cubic feet of passenger and luggage volume. Two seater – automobiles designed primarily to seat only two adults. Station wagons are included with the size class for the sedan of the same name.

Aviation – See General aviation.

- Aviation gasoline All special grades of gasoline for use in aviation reciprocating engines, as given in the American Society for Testing and Materials (ASTM) Specification D 910. Includes all refinery products within the gasoline range that are to be marketed straight or in blen ds as aviation gasoline without further processing (any refinery operation except mechanical blending). Also included are finished components in the gasoline range which will be used for blending or compounding into aviation gasoline.
- **Barges** Shallow, nonself-propelled vessels used to carry bulk commodities on the rivers and the Great Lakes.
- **Battery efficiency** Measured in percentage. Net DC energy delivered on discharge, as a percentage of the total DC energy required to r estore the initial state-of-charge. The efficiency value must include energy losses resulting from self-discharge, cell equalization, thermal loss compensation, and all battery-specific auxiliary equipment.
- **Btu** British thermal unit. The amount of energy required to raise the temperature of 1 pound of water 1 degree Fahrenheit at or near 39.2 degrees Fahrenheit. An average Btu content of fuel is the heat value per quantity of fuel as determined from tests of fuel samples.

Bunker – A storage tank.

Bunkering fuels – Fuels stored in ship bunkers.

Bus –A mode of transit service characterized by roadway vehicles powered by diesel, gasoline, battery, or alternative fuel engines contained within the vehicle.

Intercity bus: A standard size bus equipped with front doors only, high backed seats, luggage compartments separate from the passenger compartment and usually with restroom facilities, for high-speed long distance service.

Motor bus: Rubber-tired, self-propelled, manually-steered bus with fuel supply on board the vehicle. Motor bus types include intercity, school, and transit.

School and other nonrevenue bus: Bus services for which passengers are not directly charged for transportation, either on a per passenger or per vehicle basis.

Transit bus: A bus designed for frequent stop service with front and center doors, normally with a rear-mounted diesel engine, low-back seating, and without luggage storage compartments or restroom facilities.

Trolley coach: Rubbe r-tired electric transit vehicle, manually-steered, propelled by a motor drawing current, normally through overhead wires, from a central power source not on board the vehicle.

Calendar year – The period of time between January 1 and December 31 of any given year.

Captive imports – Products produced overseas specifically for domestic manufacturers.

- Carbon dioxide (CO_2) A colorless, odorless, non-poisonous gas that is a normal part of the ambient air. Carbon dioxide is a product of fossil fuel combustion.
- **Carbon monoxide** (CO) A colorless, odorless, highly toxic g as that is a by-product of incomplete fossil fuel combustion. Carbon m onoxide, one of the major air pollutants, can be harm ful in small amounts if breathed over a certain period of time.

Car-mile (railroad) – A single railroad car moved a distance of one mile.

Cargo ton-mile – See *Ton-mile*.

Certificated route air carriers – See *Air carriers*.

Class I freight railroad – See Rail.

Coal slurry – Finely crushed coal mixed with sufficient water to form a fluid.

- **Combination trucks** Consist of a power unit (a truck tractor) and one or more trailing units (a semitrailer or trailer). The most frequently used combination is popularly referred to as a "tractorsemitrailer" or "tractor trailer".
- **Commercial sector** A n energy-consuming sector that consists of serv ice-providing facilities of: businesses; Federal, State, and local governments; and other private and public organizations, such as religious, social or fraternal groups. Includes institutional living quarters.
- **Commuter rail** A mode of transit service (also called metropolitan rail, regional rail, or suburban rail) characterized by an ele ctric or diesel propelled railway for urban passenger train service consisting of local short distance travel operating between a central city and adjacent suburbs.
- **Compact car** See *Automobile size classifications*.
- **Compression ignition** The form of ignition that initiates combustion in a diesel engine. The rapid compression of a ir within the cy linders generates the heat required to ignite the fuel as it is injected.
- **Constant dollars** A time series of monetary figures is expressed in constant dollars when the effect of change over time in the purchasing power of the dollar has been removed. Usually the data are expressed in terms of dollars of a selected year or the average of a set of years.
- **Consumer Price Index (CPI)** A measure of the average change over time in the prices paid by urban consumers for a market basket of consumer goods and services.

TRANSPORTATION ENERGY DATA BOOK: EDITION 30–2011

- **Continuous discharge capacity** Measured as percent of rated energy capacity. Energy delivered in a constant power discharge required by an electric vehicle for hill climbing and/or high-speed cruise, specified as the percent of its rated energy capacity delivered in a one hour constant-power discharge.
- **Conventional Refueling Station** A n establishment for refueling motor vehicles with traditional transportation fuels, such as gasoline and diesel fuel.
- **Corporate Average Fuel Economy (CAFE) Standards** CAFE standards were originally established by Congress for new automobiles, and later for light trucks, in Title V of the Motor Vehicle Information and Cost Savings Act (15 U.S.C.1901, et seq.) with subsequent amendments. Under CAFE, automobile manufacturers are required by law to produce vehicle fleets with a composite sales-weighted fuel economy which cannot be lower than the CAFE standards in a given year, or for every vehicle which does not meet the standard, a fine of \$5.00 is paid for every one-tenth of a mpg below the standard.
- **Criteria pollutant** A pollutant determined to be hazardous to human health and regulated under EPA's National Ambient Air Quality Standards. The 1970 amendments to the Clean Air Act require EPA to describe the health and welfare impacts of a pollutant as the "criteria" for inclusion in the regulatory regime.
- **Crude oil** A mixture of hydrocarbons that exists in the liquid phase in natural underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Crude oil production is measured at the wellhead and includes lease condensate.
- **Crude oil imports** The volume of crude oil imported into the 50 States and the District of Columbia, including imports from U.S. territories, but excluding imports of crude oil into the Hawai ian Foreign Trade Zone.
- **Curb weight** The weight of a vehicle including all standard equipment, spare tire and wheel, all fluids and lubricants to capacity, full tank of fuel, and the weight of major optional accessories normally found on the vehicle.
- **Current dollars** Represents dollars current at the time designated or at the time of the transaction. In most contexts, the same meaning would be conveyed by the use of the t erm "dollars." See also constant dollars.
- **Demand Response** A transit mode that includes passenger cars, vans, and small buses operating in response to calls from passengers to the tr ansit operator who dispatches the vehicles. The vehicles do not operate over a fixed route on a fixed schedule. Can also be known as paratransit or dial-a-ride.
- **Diesel fuel** See *Distillate fuel oil*.

Disposable personal income – See *Income*.

Distillate fuel oil – The lighter fuel oils distilled off during the refining process. Included are products known as ASTM grades numbers 1 and 2 heating oils, diesel fuels, and number 4 fuel oil. The major uses of distillate fuel oils include heating, fuel for on-and off-highway diesel engines, and railroad diesel fuel.

Domestic air operator – See *Air carrier*.

Domestic water transportation – See Internal water transportation.

- **E85** 85% ethanol and 15% gasoline.
- **E95** 95% ethanol and 5% gasoline.
- **Electric utilities sector** Consists of privately and publicly owned establishments which generate electricity primarily for resale.
- **Emission standards** Limits or ranges established for pollution levels emitted by vehicles as well as stationary sources. The first standards were established under the 1963 Clean Air Act.
- **End-use sector** See *Sector*.
- **Energy capacity** Measured in kilowatt hours. The energy delivered by the battery, when tested at C/3 discharge rate, up to termination of discharge specified by the battery manufacturer. The required acceleration power must be delivered by the battery at any point up to 80% of the battery's energy capacity rating.
- **Energy efficiency** In reference to transportation, the inverse of energy intensiveness: the ratio of outputs from a process to the energy inputs; for example, miles traveled per gallon of fuel (mpg).
- **Energy intensity** In reference to transportation, the ratio of energy inputs to a process to the useful outputs from that process; for example, gallons of fuel per passenger-mile or Btu per ton-mile.
- **Ethanol** (C_2H_5OH) Oth erwise known as ethyl alcohol, alcohol, or grain-spirit. A clear, colorless, flammable oxygenated hydrocarbon with a boiling point of 78.5 degrees Celsius in the anhydrous state. In transportation, ethanol is used as a vehicle fuel by itself (E100 100% ethanol by volume), blended with gasoline (E85 85% ethanol by volume), or as a gasoline octane enhancer and oxygenate (10% by volume).
- **Excise tax** Paid when purchases are made on a specific good, such as gasoline. Excise taxes are often included in the price of the product. There are also excise taxes on activities, such as highway usage by trucks.
- **Ferry boat** A transit mode comprising vessels carrying passengers and in some cases vehicles over a body of water, and that are generally steam or diesel-powered.

Fixed operating cost – See *Operating cost*.

Fleet vehicles -

Private fleet vehicles: Ideally, a vehicle could be classified as a member of a fleet if it is:

- a) operated in mass by a corporation or institution,
- b) operated under unified control, or
- c) used for non-personal activities.

However, the definition of a fleet is not consistent throughout the fleet industry. Some companies make a distinction between cars that were bought in bulk rather than singularly, or whether they are operated in bulk, as well as the minimum number of vehicles that constitute a fleet (i.e. 4 or 10).

Government fleet vehicles: Includes vehicles owned by all Federal, state, county, city, and metro units of government, including toll road operations.

- **Foreign freight** Movements between the United States and foreign countries and between Puerto Rico, the Virgin Islands, and foreign countries. Trade between U.S. territories and possessions (e.g. Guam, Wake, American Samoa) and foreign countries is excluded. Traffic to or from the Panama Canal Zone is included.
- **Gas Guzzler Tax** Originates from the 1978 Energy Tax Act (Public Law 95-618). A new car purchaser is required to pay the tax if the car purchased has a combined city/highway fuel economy rating that is below the standard for that year. For model years 1986 and later, the standard is 22.5 mpg.
- **Gasohol** A mixture of 10% anhydrous ethanol and 90% gasoline by volume; 7.5% anhydrous ethanol and 92.5% gasoline by volume; or 5.5% anhydrous ethanol and 94.5% gasoline by volume. There are other fuels that contain methanol and gasoline, but these fuels are not referred to as gasohol.
- **Gasoline** See *Motor gasoline*.
- **General aviation** That portion of civil aviation which encompasses all facets of aviation except air carriers. It includes any air taxis, commuter air carriers, and air travel clubs which do not hold Certificates of Public Convenience and Necessity.
- **Global warming potential (GWP)** An index used to compare the relative radiative forcing of different gases without directly calculating the chang es in atmospheric concentrations. GWPs are calculated as the ratio of the radiative forcing that would result from the emission of one kilogram of a greenhouse gas to that from the emission of one kilogram of carbon diox ide over a fixed period of time, such as 100 years.
- **Greenhouse gases** Those gases, such a s water vapor, carbon dio xide, nitrous oxide, methane, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sul fur hexafluoride, that are transparent to solar (short-wave) radiation but opaque to long-wave (infrared) radiation, thus preventing long-wave radiant energy from leaving Earth's atmosphere. The net effect is a trapping of absorbed radiation and a tendency to warm the planet's surface.
- **Gross National Product** A measure of monetary value of the goods and services becoming available to the nation from economic activity. Total value at market prices of a ll goods and services produced by the nation's economy. Calculated quarterly by the Department of Commerce, the Gross National Product is the broadest available measure of the level of economic activity.

Gross vehicle weight (gvw) – The weight of the empty truck plus the maximum anticipated load weight.

- **Gross vehicle weight rating (gvwr)** The gross vehicle weight which is assigned to each new truck by the manufacturer. This rating may be different for trucks of the same model because of certain features, such as heavy-duty suspension. Passenger cars do not have gross vehicle weight ratings.
- **Heavy-heavy truck** See *Truck size classifications*.
- **Heavy rail** A mode of transit service (also called metro, subway, rapid transit, or rapid rail) operating on an electric railway with the capacity for a heav y volume of traffic. Characterized by high speed and rapid acceleration of passenger rail cars.
- **Household** Consists of all persons who occupy a housing unit, including the related family members and all unrelated persons, if any, who share the housing unit.

- **Housing unit** A house, apartment, a group of rooms, or a sing le room occupied or in tended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which have either (1) direct access from the outs ide of the building or through a common hallway intended to be used by the occupants of another unit or by the general public, or (2) complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or unrelated persons who share living arrangements.
- **Hybrid-electric vehicles** Combines the benefits of gasoline engines and electric motors and can be configured to obtain different objectives, such as improved fuel economy, increased power, or additional auxiliary power for electronic devices and power tools.
- **Hydrocarbon** (**HC**) A c ompound that contains only hydrogen and carbon. The simplest and lightest forms of hydrocarbon are gaseous. With greater molecular weights they are liquid, while the heaviest are solids.

Income -

Disposable personal income: Personal income less personal tax and non-tax payments.

National income: The aggregate earnings of labor and property which arise in the current production of goods and services by the nation's economy.

Personal income: The current income received by persons from all sources, net of contributions for social insurance.

Industrial sector – Construction, manufacturing, agricultural and mining establishments.

Inertia weight – The curb weight of a vehicle plus 300 pounds.

Intercity bus – See *Bus*.

- **Intermodal** Transportation activities involving more than one mode of transportation, including transportation connections and coordination of various modes.
- **Internal water transportation** Includes all local (intraport) traffic and traffic between ports or landings wherein the entire movement takes place on inland waterways. Al so termed internal are movements involving carriage on both inland waterways and the water of the Great Lakes, and inland movements that cross short stretches of open water that link inland systems.

International air operator – See *Air carrier*.

International freight – See *Foreign freight*.

Jet fuel – Includes both naphtha-type and kerosene-type fuels meeting standards for use in aircraft turbine engines. Although most jet fuel is used in aircraft, some is used for other purposes such as generating electricity in gas turbines.

Kerosene-type jet fuel: A quality kerosene product with an average gravity of 40.7 degrees API and 10% to 90% distillation temperatures of 217 to 261 degrees centigrade. Used primarily as fuel for commercial turbojet and turboprop aircraft engines. It is a relatively low freezing point distillate of the kerosene type.

Naphtha-type jet fuel: A fuel in the heavy naphtha boiling range with an average gravity of 52.8 degrees API and 10% to 90% distillation temperatures of 117 to 233 degrees centigrade used for turbojet and turboprop aircraft engines, primarily by the military. Excludes ramjet and petroleum.

Kerosene – A p etroleum distillate in the 300 to 500 degrees Fahrenheit boiling range and g enerally having a flash point higher than 100 degrees Fahrenheit by the American Society of Testing and Material (ASTM) Method D56, a gravity range from 40 to 46 degrees API, and a burning point in the range of 150 to 175 degrees Fahrenheit. It is a clean-burning product suitable for use as an illuminant when burned in wick lamps. Includes grades of kerosene called range oil h aving properties similar to Number 1 fuel oil, but with a gravity of about 43 degrees API and an end point of 625 degrees Fahrenheit. Used in space heaters, cooking stoves, and water heaters.

Kerosene-type jet fuel – See Jet fuel.

- Large car See Automobile size classifications.
- Lease Condensate A liquid recovered from natural gas at the well or at small gas/oil separators in the field. Consists primarily of pentanes and heavier hydrocarbons (also called field condensate).
- Light duty vehicles Automobiles and light trucks combined.
- **Light truck** Unless otherwise noted, light trucks are defined in this publication as two-axle, four-tire trucks. The U.S. Bureau of Census c lassifies all trucks with a g ross vehicle weight less than 10,000 pounds as light trucks (See Truck size classifications).
- **Light-heavy truck** See *Truck size classifications*.
- **Light rail** Mode of transit service (also called streetcar, tramway or trolley) operating passenger rail cars singly (or in short, usually two-car or three-car trains) on fixed rails in right-of-way that is often separated from other traffic for part or much of the way.
- Liquified petroleum gas (lpg) Consists of propane and butane and is usually derived from natural gas. In locations where there is no natural gas and the gasoline consumption is low, naphtha is converted to lpg by catalytic reforming.
- Load factor Total passenger miles divided by total vehicle miles.
- **Low emission vehicle** Any vehicle certified to the low emission standards which are set by the Federal government and/or the state of California.
- M85 85% methanol and 15% gasoline.
- **M100** 100% methanol.
- **Medium truck** See *Truck size classifications*.
- **Methanol** (CH_3OH) A colorless highly toxic liquid with essentially no odor and very little taste. It is the simplest alcohol and boils at 64.7 degrees Celsius. In transportation, methanol is used as a vehicle fuel by itself (M100), or blended with gasoline (M85).
- Midsize car See Automobile size classifications.

Model year – In this publication, model year is referring to the "sales" model year, the period from October 1 to the next September 31.

Motor bus – See *Bus*.

Motor gasoline – A m ixture of volatile hydrocarbons suitable for operation of an internal combustion engine whose major components are hydrocarbons with boiling points ranging from 78 to 217 degrees centigrade and whose source is distillation of petroleum and cracking, polymerization, and other chemical reactions by which the n aturally occurring petroleum hydrocarbons are converted into those that have superior fuel properties.

Regular gasoline: Gasoline having an antiknock index, i.e., octane rating, greater than or equal to 85 and less than 88. Note: Octane requirements may vary by altitude.

Midgrade gasoline: Gasoline having an antiknock index, i.e., octane rating, greater than or equal to 88 and less than or equal to 90. Note: Octane requirements may vary by altitude.

Premium gasoline: Gasoline having an antik nock index, i.e., octane rating, greater than 90. Note: Octane requirements may vary by altitude.

Reformulated gasoline: Finished motor gasoline formulated for use in motor vehicles, the composition and properties of which meet the requirements of the reformulated gasoline regulations promulgated by the U.S. Env ironmental Protection Agency under Section 211(k) of the Clean Air Act. For details on this clean fuel program see http://www.epa.gov/otaq/rfg.htm. Note: This category includes oxygenated fuels program reformulated gasoline (OPRG) but excludes reformulated gasoline blendstock for oxygenate blending (RBOB).

- **MTBE** Methyl Tertiary Butyl Ether–a colorless, flammable, liquid oxygenated hydrocarbon containing 18.15 percent oxygen.
- Naphtha-type jet fuel See *Jet fuel*.

National income – See Income.

- Nationwide Personal Transportation Survey (NPTS) A nat ionwide survey of households that provides information on the characteristics and personal travel patterns of the U.S. population. Surveys were conducted in 1969, 1977, 1983, 1990, and 1995 by the U.S. Bureau of Census for the U.S. Department of Transportation.
- **Natural gas** A mixture of hydrocarbon compounds and small quantities of various non-hydrocarbons existing in the g aseous phase or in solution with crude oil in natural underground reservoirs at reservoir conditions.

Natural gas, dry: Natural gas which remains after: 1) the liquefiable hydrocarbon portion has been removed from the gas st ream; and 2) any volumes of nonhydrocarbon gases have been removed where they occur in sufficient quantity to render the gas unmarketable. Dry natural gas is also known as consumer-grade natural gas. The parameters for measurement are cubic feet at 60 degrees Fahrenheit and 14.73 pounds per square inch absolute.

Natural gas, wet: The volume of natural gas remaining after removal of lease condensate in lease and/or field separation facilities, if any, and after exclusion of nonhydrocarbon gases where they

occur in sufficient quantity to render the gas unmarketable. Natural gas liquids may be recovered from volumes of natural gas, wet after lease separation, at natural gas processing plants.

Natural gas plant liquids: Natural gas liquids recovered from natural gas in processing plants and from natural gas field facilities and fractionators. Products obtained include ethane, propane, normal butane, isobutane, pentanes plus, and other products from natural gas processing plants.

- Nitrogen oxides (NO_x) A product of combustion of fossil fuels whose production increases with the temperature of the process. It can become an air pollutant if concentrations are excessive.
- Nonattainment area Any area that does not meet the national primary or secondary ambient air quality standard established by the Environmental Protection Agency for designated pollutants, such as carbon monoxide and ozone.
- **Oil Stocks** Oil stocks include crude oil (including strategic reserves), unfinished oils, natural gas plant liquids, and refined petroleum products.

Operating cost -

Fixed operating cost: In reference to passenger car operating cost, refers to those expenditures that are independent of the amount of use of the car, such as insurance costs, fees for license and registration, depreciation and finance charges.

Variable operating cost: In reference to passenger car operating cost, expenditures which are dependent on the amount of use of t he car, such as the cost of g as and oil, tires, and oth er maintenance.

Organization for Economic Cooperation and Development (OECD) – Consists of Australia, Austria, Belgium, Canada, Cz ech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Japan, Luxembourg, Mexico, Netherlands, New Zealand, Norway, Poland, Portugal, South Korea, Spain, Sweden, Switzerland, Turkey, United Kingdom, and United States. Total OECD includes the United States Territories (Guam, Puerto Rico, and the U.S. Virgin Islands). Total OECD excludes data for Czech Republic, Hungary, Mexico, Poland, and South Korea which are not yet available.

OECD Europe: Con sists of Aus tria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Poland, Portugal, Spain, Sweden, Switzerland, Turkey, and United Kingdom. OECD Europe excludes data for Czech Republic, Hungary, and Poland which are not yet available.

OECD Pacific: Consists of Australia, Japan, and New Zealand.

- **Organization for Petroleum Exporting Countries (OPEC)** Includes Saudi Arabia, Iran, Venezuela, Libya, Indonesia, United Arab Emirates, Algeria, Nigeria, Ecuador, Gabon, Iraq, Kuwait, and Qatar. D ata for Saudi Arabia and Kuwait include their shares from the P artitioned Zone (formerly the Neutral Zone). Angola joined OPEC in December 2006, thus, beginning in 2007, data on OPEC will include Angola.
- Arab OPEC Consists of Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia and the Un ited Arab Emirates.

Other single-unit truck – See *Single-unit truck*.

- **Oxygenate** A substance which, when added to gasoline, increases the amount of oxygen in that gasoline blend. Includes fuel ethanol, methanol, and methyl tertiary butyl ether (MTBE).
- **Paratransit** Mode of transit service (also called demand response or dial-a-ride) characterized by the use of passenger automobiles, vans or small buses operating in response to calls from passengers or their agents to the transit operator, who then dispatches a vehicle to pick up the passengers and transport them to their destinations.
- **Particulates** Carbon particles formed by partial oxidation and reduction of the hydrocarbon fuel. Also included are trace quantities of m etal oxides and nitrides, originating from engine wear, component degradation, and inorganic fuel additives. In the transportation sector, particulates are emitted mainly from diesel engines.
- **Passenger-miles traveled (PMT)** One person traveling the distance of one mile. Total passenger-miles traveled, thus, give the total mileage traveled by all persons.
- Passenger rail See Rail, "Amtrak" and "Transit Railroad".
- Persian Gulf countries Consists of Bahrain, Iran, Iraq, Kuwait, Qatar, Saudi Arabia, and the United Emirates.
- **Personal Consumption Expenditures (PCE)** As used in the national accounts, the market value of purchases of goods and services by individuals and nonprofit institutions and the value of food, clothing, housing, and financial services received by them as in come in kind. It includes the rental value of owner-occupied houses but excludes purchases of dwellings, which are classified as capital goods (investment).

Personal income – See Income.

Petroleum – A g eneric term applied to oil and oil products in all forms, such as crude oil, lease condensate, unfinished oil, refined petroleum products, natural gas plant liquids, and non-hydrocarbon compounds blended into finished petroleum products.

Petroleum consumption: A calcu lated demand for petroleum products obtained by summing domestic production, imports of crude petroleum and natural gas liquids, imports of petroleum products, and the primary stocks at the beginning of the period and then subtracting the exports and the primary stocks at the end of the period.

Petroleum exports: Ship ments of petroleum products from the 50 States and the District of Columbia to foreign countries, Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

Petroleum imports: All imports of crude petroleum, natural gas liquids, and petroleum products from foreign countries and receipts from Guam, Puerto Rico, the Virgin Islands, and the Hawaiian Trade Zone. The commodities included are crude oil, unfinished oils, plant condensate, and refined petroleum products.

Petroleum inventories: The amounts of crude oil, unfinished oil, petroleum products, and natural gas liquids held at refineries, at natural gas processing plants, in pipelines, at bulk terminals operated by refining and pipeline companies, and at independent bulk terminals. Crude oil held in storage on le ases is also included; these stocks are k nown as primary stocks. Secondary stocks—those held by jobbers dealers, service station operators, and consumers—are

excluded. Prior to 1975, stock held at independent bulk terminals were classified as secondary stocks.

Petroleum products supplied: For each petroleum product, the amount supplied is calculated by summing production, crude oil burned directly, imports, and net wi thdrawals from primary stocks and subtracting exports.

Plug-in hybrid-electric vehicles (PHEVs) — Hybrid-electric vehicles with high capacity batteries that can be charged by plugging them into an electrical outlet or charging station. There are two basic PHEV configurations:

Parallel or Blended PHEV: Both the engine and electric motor are mechanically connected to the wheels, and both propel the vehicle under most driving conditions. Electric-only operation usually occurs only at low speeds.

Series PHEVs, also called Extended Range Electric Vehicles (EREVs): Only the electric motor turns the wheels; the gasoline engine is only used to generate electricity. Series PHEVs can run solely on electricity until the battery needs to be recharged. The gasoline engine will then generate the electricity needed to power the electric motor. For shorter trips, these vehicles might use no gasoline at all.

- **Processing Gain** The amount by which the total volume of refinery output is greater than the volume of input for given period of time. The processing gain arises when crude oil and other hydrocarbons are processed into products that are, on average, less dense than the input.
- **Processing Loss** The amount by which the total volume of refinery output is less than the volume of input for given period of time. The processing loss arises when crude oil and other hydrocarbons are processed into products that are, on average, more dense than the input.
- **Proved Reserves of Crude Oil** The estimated quantities of all liquids defined as crude oil, which geological and engineering data demonstrate with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions.
- **Quad** Quadrillion, 10^{15} . In this publication, a Quad refers to Quadrillion Btu.

Rail –

Amtrak (American Railroad Tracks): O perated by the N ational Railroad Passenger Corporation of Washington, DC. This rail system was created by President Nixon in 1970, and was given the responsibility for the operation of intercity, as distinct from suburban, passenger trains between points designated by the Secretary of Transportation.

Class I freight railroad: Defined by the Interstate Commerce Commission each year based on annual operating revenue. A railr oad is dropped from the Class I list if it fails to meet the annual earnings threshold for three consecutive years.

Commuter railroad: Those portions of mainline railroad (not electric railway) transportation operations which encompass urban passenger train service for local travel between a central city and adjacent suburbs. C ommuter railroad service–using both locomotive-hauled and self-propelled railroad passenger cars–is characterized by multi-trip tickets, specific station-to-station fares, and u sually only one or two s tations in the central business district. Also k nown as suburban railroad.

Transit railroad: Includes "heavy" and "light" transit rail. **Heavy transit rail** is characterized by exclusive rights-of-way, multi-car trains, high speed rapid acceleration, sophisticated signaling, and high platform loading. Also k nown as subway, elevated railway, or metropolitan railway (metro). **Light transit rail** may be on ex clusive or shared rights-of-way, high or low platform loading, multi-car trains or single cars, automated or manually operated. In generic usage, light rail includes streetcars, trolley cars, and tramways.

- **Refiner sales price** S ales from the re finery made directly to u ltimate consumers, including bulk consumers (such as agriculture, industry, and electric utilities) and residential and commercial consumers.
- **Reformulated gasoline** (**RFG**) See *Motor gasoline*.
- **RFG area** An oz one nonattainment area designated by the Environmental Protection Agency which requires the use of reformulated gasoline.
- **Residential sector** An energy consuming sector that consists of living quarters for private households. Excludes institutional living quarters.
- **Residential Transportation Energy Consumption Survey (RTECS)** This survey was designed by the Energy Information Administration of the Department of Energy to provide information on how energy is used by households for personal vehicles. It has been conducted five times since 1979, the most recent being 1991.
- **Residual fuel oil** The heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are boiled off in refinery operations. Included are products know as ASTM grade numbers 5 and 6 oil, heavy diesel oil, Navy Special Fuel Oil, Bunker C oil, and acid sludge and pitch used as refinery fuels. Residual fuel oil is used for the production of electric power, for heating, and for various industrial purposes.
- Rural Usually refers to areas with population less than 5,000.
- **Sales period** October 1 of the previous year to September 30 of the given year. Approximately the same as a model year.
- Sales-weighted miles per gallon (mpg) Calculation of a composite vehicle fuel economy based on the distribution of vehicle sales.
- Scrappage rate As applied to motor vehicles, it is usually expressed as the percentage of vehicles of a certain type in a given age class that are retired from use (lacking registration) in a given year.
- School and other nonrevenue bus See *Bus*.
- **Sector** A group of major energy-consuming components of U.S. society developed to measure and analyze energy use. The sectors most commonly referred to are : residential, commercial, industrial, transportation, and electric power.

Single-unit truck – Includes two-axle, four-tire trucks and other single-unit trucks.

Two-axle, four-tire truck: A motor vehicle consisting primarily of a single motorized device with two axles and four tires.

Other single-unit truck: A motor vehicle consisting primarily of a single motorized device with more than two axles or more than four tires.

- **Spark ignition engine** An internal combustion engine in which the charge is ignited electrically (e.g., with a spark plug).
- **Special fuels** Consist primarily of diesel fuel with small amount of liquified petroleum gas, as defined by the Federal Highway Administration.
- **Specific acceleration power** Measured in watts per kilogram. Acceleration power divided by the battery system weight. Weight must include the total battery system.
- **Specific energy** Measured in watt hours per kilogram. The rated energy capacity of the battery divided by the total battery system weight.
- **Subcompact car** See Automobile size classifications.
- **Supplemental air carrier** See *Air carrier*.
- **Survival rate** As applied to motor vehicles, it is usually expressed as the percentage of vehicles of a certain type in a given age class that will be in use at the end of a given year.
- **Tax incentives** I n general, a m eans of employing the t ax code to stimulate investment in o r development of a socially desirable economic objective without direct expenditure from the budget of a given unit of government. Such incentives can take the form of tax exemptions or credits.
- **Test weight** The weight setting at which a v ehicle is tested on a dynomometer by the U.S. Environmental Protection Agency (EPA). This weight is determined by the EPA using the inertia weight of the vehicle.
- **Ton-mile** The movement of one ton of freight the distance of one mile. Ton-miles are computed by multiplying the weight in tons of each shipment transported by the distance hauled.

Transmission types -

- A3 Automatic three speed A4 – Automatic four speed
- A5 Automatic five speed
- L4 Automatic lockup four speed
- M5 Manual five speed

Transit bus – See Bus.

Transit railroad – See Rail.

- **Transportation sector** Consists of both private and public passenger and freight transportation, as well as government transportation, including military operations.
- **Truck Inventory and Use Survey (TIUS)** Survey designed to collect data on the characteristics and operational use of the nation's truck population. It is conducted every five years by the U.S. Bureau of the Census. Surveys were conducted in 1963, 1967, 1972, 1977, 1982, 1987, and 1992. For the 1997 survey, it was renamed the Vehicle Inventory and Use Survey in anticipation

of including additional vehicle types. However, no additional vehicle types were added to the 1997 survey.

- **Trolleybus** Mode of transit service (also called transit coach) using vehicles propelled by a motor drawing current from overhead wires via connecting poles called a trolley pole, from a central power source not onboard the vehicle.
- **Truck size classifications** U.S. Bureau of the Census has categorized trucks by gross vehicle weight (gvw) as follows:

Light – Less than 10,000 pounds gvw (Also see Light Truck.) Medium – 10,001 to 20,000 pounds gvw Light-heavy – 20,001 to 26,000 pounds gvw Heavy-heavy – 26,001 pounds gvw or more.

- **Two-axle, four-tire truck** See *Single-unit truck*.
- **Two seater car** See Automobile size classifications.
- **Ultra-low emission vehicle** Any vehicle certified to the ultra-low emission standards which are set by the Federal government and/or the state of California.

Urban – Usually refers to areas with population of 5,000 or greater.

- **Vanpool**: A ridesharing prearrangement using vans or small buses providing round-trip transportation between the participants's prearranged boarding points and a common and regular destination.
- Variable operating cost See Operating cost.
- Vehicle Inventory and Use Survey See Truck Inventory and Use Survey.
- **Vehicle-miles traveled (vmt)** One vehicle traveling the distance of one mile. Total vehicle miles, thus, is the total mileage traveled by all vehicles.
- **Volatile organic compounds (VOCs)** Org anic compounds that participate in atmospheric photochemical reactions.

Waterborne Commerce -

Coastwise: Domestic traffic receiving a carriage over the ocean, or the Gulf of Mexico. Traffic between Great Lakes ports and sea coast ports, when having a carriage over the ocean, is also termed Coastwise.

Domestic: Includes coastwise, lakewise, and internal waterborne movements.

Foreign: Waterborne import, export, and in-transit traffic between the United States, Puerto Rico and the Virgin Islands and any foreign country.

Internal: Vessel movements (origin and de stination) which take place solely on in land waterways. An in land waterway is one geographically located within the boundaries of the contiguous 48 states or within the boundaries of the State of Alaska.

Lakewise: Waterborne traffic between the United States ports on the Great Lakes System. The Great Lakes System is treated as a separate waterway system rather than as a part of the inland waterway system. In comparing historical data for the Great Lakes System, one should note that prior to calendar year 1990, marine products, sand and gravel being moved from the Great Lakes to Great Lake destinations were classified as local traffic. From 1990-on, these activities are classified as lakewise traffic.

- **Well-to-wheel** A life cycle analysis used in transportation to consider the entire energy cycle for a given mode, rather than just tailpipe emissions. The analysis starts at the oil well and ends with the turning wheels of the vehicle.
- **Zero-emission vehicle** Any vehicle certified to the zero emission standards which are set by the Federal government and/or the state of California. These standards apply to the vehicle emissions only.
